

QNAME minimiz(s?)ation

Stéphane Bortzmeyer - AFNIC

IETF 91 - Honolulu

- 1 Now a working-group document
`draft-ietf-dnsop-qname-minimisation`
- 2 Intended status is informational, should move to experimental?
- 3 Reminder: it's a **unilateral** change. Each resolver may do it a bit differently.
- 4 Relationship with `draft-vixie-dnsexp-resimprove`, section 3 (NXDOMAIN for ENTs)

What's missing now?

- ① A test implementation in a resolver? I would love to be able to compile with `--enable-qname-m12n`.
- ② Actual quantitative tests with a real workload (depends on the previous item) to see the performances, and to see if something breaks
- ③ A more detailed/formal theoretical analysis?
