YANG Model for QoS Operational Parameters
draft-asechoud-rtgwg-qos-oper-model-04

Abstract

This document describes a YANG model for Quality of Service (QoS) operational parameters.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 2, 2020.

Copyright Notice

This document is subject to BCP 78 and the IETF Trust’s Legal Provisions Relating to IETF Documents (https://trustee.ietf.org/license-info) in effect on the date of publication of this document. Please review these documents carefully, as they describe your rights and restrictions with respect to this document. Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.
1. Introduction

This document defines a base YANG [RFC6020] [RFC7950] data module for Quality of Service (QoS) operational parameters. Remote Procedure Calls (RPC) or notification definition is currently not part of this document and will be added later if necessary. QoS configuration modules are defined by [I-D.asechoud-rtgwg-qos-model].

This document doesn’t include operational parameters for random-detect (RED), which is left to individual vendor to augment it.

Editorial Note: (To be removed by RFC Editor)

This draft contains several placeholder values that need to be replaced with finalized values at the time of publication. Please apply the following replacements:

- "XXXX" --> the assigned RFC value for this draft both in this draft and in the YANG models under the revision statement.
- The "revision" date in model, in the format XXXX-XX-XX, needs to be updated with the date the draft gets approved.

The YANG modules in this document conform to the Network Management Datastore Architecture (NMDA) [RFC8342].

1.1. Tree Diagrams

Tree diagrams used in this document follow the notation defined in [RFC8340]
2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

3. QoS Operational Model Design

QoS operational model include QoS policy applied to an interface in each direction of traffic. For each QoS policy applied to an interface the model further includes counters for associated Classifiers, Meters and Queues in a particular direction. To modularize and for reusability, grouping have been defined for various counters of Classfier, Meters and Queues. The target is assumed to be interface but the groupings can be used for any other target type where QoS policy is applied.

[I-D.asechoud-rtgwg-qos-model] defines various building blocks for applying a QoS Policy on a target. It includes QoS Policy configuration, which is a container of various classifiers and corresponding actions which are configured for traffic conditioning. This drafts defines the various counters for these building blocks.ietf-qos-oper module defined in this draft augments ietf-interfaces [RFC8343] module.

Classifier statistics contains counters for packets and bytes matched to the traffic in a direction and also average rate at which traffic is hitting a classifier. Classification criterion may be based on IP, MPLS or Ethernet. Counters defined in this draft are agnostic to underlying dataplane technology.

Statistics of meter is modeled based on commonly used alogrithms in industry, Single Rate Tri Color Marking (srTCM) [RFC2697] meter, Two Rate Tri Color Marking (trTCM) [RFC2698] meter. Metering statistics includes counters corresponding to various rates configured. A metering container is referred by a metering identifier. This identifier could be a classifier name if the metering configuration is inline with classifier or it could be metering template name if the metering is configured as separate entity and associated with the classifier.

Queuing statistics includes counters corresponding to various queues associated with the policy. A queuing container is referred by queuing identifier. This identifier could be a classifier name if the queuing configuration is inline with classifier and hence there is one-to-one mapping between a classifier and a queue or it could be
a separate queue identifier if one or more than one classifiers are associated with a queue.

4. Modules Tree Structure

This document defines counters for classifiers, meters and queues.

Classifier statistics consists of list of classifier entries identified by a classifier entry name. Classifier counters include matched packets, bytes and average rate of traffic matching a particular classifier.

Metering statistics consists of meters identified by an identifier. Metering counters include conform, exceed, violate and drop packets and bytes.

Queuing counters include instantaneous, peak, average queue length, as well as output conform, exceed, tail drop packets and bytes.
