Bundle Protocol Agent Application Data Model
draft-birrane-dtn-adm-bp-03

Abstract

This document describes the Application Data Model (ADM) for a Bundle Protocol Agent (BPA) in compliance with the template provided by [I-D.birrane-dtn-adm].

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 12, 2019.

This document is subject to BCP 78 and the IETF Trust’s Legal Provisions Relating to IETF Documents (https://trustee.ietf.org/license-info) in effect on the date of publication of this document. Please review these documents carefully, as they describe your rights and restrictions with respect to this document. Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.
1. Introduction

An Application Data Model (ADM) provides a guaranteed interface for the management of an application or protocol in accordance with the Asynchronous Management Architecture (AMA) defined in [I-D.birrane-dtn-ama]. The ADM described in this document complies with the ADM Template provided in [I-D.birrane-dtn-adm] as encoded using the JSON syntax.

Bundle Protocol Agents (BPAs) are software instances that implement functionality required by the Bundle Protocol ([I-D.ietf-dtn-bpbis]). The BPA ADM provides the set of information necessary to remotely manage such agents.

1.1. Technical Notes

- This document describes Version 0.1 of the BP ADM.
- The AMM Resource Identifier (ARI) for this ADM is NOT correctly set. A sample ARI is used in this version of the specification and MAY change in future versions of this ADM until an ARI registry is established. This notice will be removed at that time.
- Agent applications MAY choose to ignore the name, description, or other annotative information associated with the component definitions within this ADM where such items are only used to provide human-readable information or are otherwise not necessary to manage a device.
1.2. Scope

This ADM specifies those components of the Asynchronous Management Model (AMM) common to the management of any instance of a BPA.

Any Manager software implementing this ADM MUST perform the responsibilities of an AMA Manager as outlined in [I-D.birrane-dtn-adm] as they relate to the objects included in this document.

Any Agent software implementing this ADM MUST perform the responsibilities of an AMA Agent as outlined in [I-D.birrane-dtn-adm] as they relate to the objects included in this document.

1.3. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

2. Structure and Design of this ADM

The BP Agent ADM’s structure is in accordance to [I-D.birrane-dtn-adm]. This ADM contains metadata, edd, report templates, and controls. Externally Defined Data (EDD) are values that are calculated external to the ADM system. Report Templates are ordered sets of data descriptions that show how values will be represented in a corresponding report. Controls are predefined and sometimes parameterized opcodes that can be run on an Agent. Controls are preconfigured in Agents and Managers as part of ADM support. There are no variables, table templates, macros, constants, or operators in this ADM at this time. The contents of this ADM are derived from the main functions and data that are needed to configure and manage bundle protocol operations on an ION node.

All ADMs have metadata that includes the name, namespace, and version of the ADM as well as the name of the organization that is issuing that particular ADM. This is important for identification purposes of the ADMs and to ensure version control. The main elements of BP that are discussed in this ADM are endpoints, the priority of bundles/bytes, and whether or not the bundles/bytes were transferred successfully.

3. Naming and Identification

This section outlines the namespaces used to uniquely identify ADM objects in this specification.
3.1. Namespace and Nicknames

In accordance with [I-D.birrane-dtn-adm], every ADM is assigned a moderated Namespace. In accordance with [I-D.birrane-dtn-amp], these namespaces may be enumerated for compactness. The namespace and ADM identification for these objects is defined as follows.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Namespace</td>
<td>DTN/bp_agent</td>
</tr>
<tr>
<td>ADM Enumeration</td>
<td>2</td>
</tr>
</tbody>
</table>

Table 1: Namespace Information

Given the above ADM enumeration, in accordance with [I-D.birrane-dtn-amp], the following AMP nicknames are defined.

<table>
<thead>
<tr>
<th>Nickname</th>
<th>Collection</th>
</tr>
</thead>
<tbody>
<tr>
<td>40</td>
<td>DTN/bp_agent/Const</td>
</tr>
<tr>
<td>41</td>
<td>DTN/bp_agent/Ctrl</td>
</tr>
<tr>
<td>42</td>
<td>DTN/bp_agent/Edd</td>
</tr>
<tr>
<td>43</td>
<td>DTN/bp_agent/Mac</td>
</tr>
<tr>
<td>44</td>
<td>DTN/bp_agent/Oper</td>
</tr>
<tr>
<td>45</td>
<td>DTN/bp_agent/Rptt</td>
</tr>
<tr>
<td>47</td>
<td>DTN/bp_agent/Tblt</td>
</tr>
<tr>
<td>49</td>
<td>DTN/bp_agent/Var</td>
</tr>
<tr>
<td>50</td>
<td>DTN/bp_agent/Mdat</td>
</tr>
<tr>
<td>51-59</td>
<td>DTN/bp_agent/Reserved</td>
</tr>
</tbody>
</table>

Table 2: BP Agent ADM Nicknames
4. BP Agent ADM JSON Encoding

The following is the JSON encoding for the Bundle Protocol Agent ADM:

```json
{
    "Mdat": [
        {
            "name": "name",
            "type": "STR",
            "value": "bp_agent",
            "description": "The human-readable name of the ADM."
        },
        {
            "name": "namespace",
            "type": "STR",
            "value": "DTN/bp_agent",
            "description": "The namespace of the ADM."
        },
        {
            "name": "version",
            "type": "STR",
            "value": "v0.1",
            "description": "The version of the ADM"
        },
        {
            "name": "organization",
            "type": "STR",
            "value": "JHUAPL",
            "description": "The name of the issuing organization of the ADM."
        }
    ],
    "Edd": [
        {
            "name": "bp_node_id",
            "type": "STR",
            "description": "The node administration endpoint"
        },
        {
            "name": "bp_node_version",
            "type": "STR",
            "description": "The latest version of the BP supported by this node"
        },
        {
            "name": "available_storage",
            "type": "UVAST",
            "description": "Bytes available for bundle storage"
        }
    ]
}
```
<table>
<thead>
<tr>
<th>name</th>
<th>type</th>
<th>description</th>
