Constrained Application Protocol (CoAP) Hop Limit Option
draft-boucadair-core-hop-limit-00

Abstract

The presence of Constrained Application Protocol (CoAP) proxies may lead to infinite forwarding loops, which is undesirable. To prevent and detect such loops, this document specifies the Hop-Limit CoAP option.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on February 17, 2019.

1. Introduction

More and more applications are using Constrained Application Protocol (CoAP) [RFC7252] as a communication protocol between involved application agents. For example, [I-D.ietf-dots-signal-channel] specifies how CoAP is used as a distributed denial-of-service (DDoS) attack signaling protocol seeking for help from DDoS mitigation providers. In such contexts, a CoAP client can communicate directly with a server or indirectly via a proxy.

When multiple proxies are involved, infinite forwarding loops may be experienced. To prevent such loops, this document defines a new CoAP option, called Hop-Limit, which is inserted by on-path proxies. Also, the document defines a new CoAP Response Code to report loops together with relevant diagnostic information to ease troubleshooting.

2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

Readers should be familiar with the terms and concepts defined in [RFC7252].
3.  Hop-Limit Option

Hop-Limit option (see Section 4.2) is used to detect and prevent infinite loops when proxies are involved. Only one single instance of the option is allowed in a message.

The length of the Hop-Limit option is 1 byte. The value of the Hop-Limit option is encoded as an unsigned integer (see Section 3.2 of [RFC7252]).

Each intermediate proxy involved in the handling of a CoAP message MUST decrement the Hop-Limit option value by 1 prior to forwarding upstream if this parameter exists.

CoAP messages MUST NOT be forwarded if the Hop-Limit option is set to ‘0’ after decrement. Messages that cannot be forwarded because of exhausted Hop-Limit SHOULD be logged with a 5.06 (Hop Limit Reached) error message sent back to the CoAP peer. It is RECOMMENDED that CoAP agents support means to alert administrators about loop errors so that appropriate actions are undertaken.

To ease debugging and troubleshooting, the CoAP proxy which detects a loop SHOULD include its information (e.g., server name, server alias, IP address) in the diagnostic payload under the conditions detailed in Section 5.5.2 of [RFC7252].

Each intermediate proxy involved in relaying a 5.06 (Hop Limit Reached) error message SHOULD prepend its own information in the diagnostic payload with a space character used as separator. Only one information per proxy MUST appear in the diagnostic payload.

The initial Hop-Limit value SHOULD be configurable. If no initial value is explicitly provided, the default initial Hop-Limit value of 16 MUST be used. Because forwarding errors may occur if inadequate Hop-Limit values are used, proxies at the boundaries of an administrative domain MAY be instructed to rewrite the value of Hop-Limit carried in received messages (that is, ignore the value of Hop-Limit received in a message).

4.  IANA Considerations

4.1.  CoAP Response Code

IANA is requested to add the following entries to the "CoAP Response Codes" sub-registry available at https://www.iana.org/assignments/core-parameters/core-parameters.xhtml#response-codes:
4.2. CoAP Option Number

IANA is requested to add the following entry to the "CoAP Option Numbers" sub-registry available at https://www.iana.org/assignments/core-parameters/core-parameters.xhtml?option-numbers:

<table>
<thead>
<tr>
<th>Number</th>
<th>C</th>
<th>U</th>
<th>N</th>
<th>R</th>
<th>Name</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td></td>
<td>x</td>
<td>-</td>
<td></td>
<td>Hop-Limit</td>
<td>[RFCXXXX]</td>
</tr>
</tbody>
</table>

C=Critical, U=Unsafe, N=NoCacheKey, R=Repeatable

5. Security Considerations

Security considerations related to CoAP proxying are discussed in Section 11.2 of [RFC7252].
