1. Abstract

ITU-T Recommendation G.722.1 is a wideband coder, it operates at one of two selectable bit rates, 24kbit/s or 32kbit/s. This document describes the payload format for including G.722.1 generated bit streams within an RTP packet. Also included here are the necessary details for the use of G.722.1 with MIME and SDP.

2. Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC-2119.

3. Overview of ITU-T Recommendation G.722.1

G.722.1 is a low complexity coder, it compresses 50Hz - 7kHz audio signals into one of two bit rates, 24 kbit/s or 32 kbit/s. The coder may be used for speech, music and other types of audio.

Some of the applications for which this coder is suitable are:

- Real-time communications such as videoconferencing and telephony.
A fixed frame size of 20 ms is used, and for any given bit rate the number of bits in a frame is a constant.

4. RTP payload format for G.722.1

The RTP timestamp MUST be in units of 1/16000 of a second. The RTP payload for G.722.1 has the following format:

```
+-------------+-------------+-------------+-------------+
|                      RTP Header [3]                         |
|   +==============+==============+==============+==============+    |
|   | one or more frames of G.722.1  | one or more frames of G.722.1  |    |
|   +==============+==============+==============+==============+    |
```

G.722.1 uses 20 ms frames and a sampling rate clock of 16 kHz. The bit rate can be changed at any 20 ms frame boundary, although bit rate change notification is not provided inband with the bit stream - therefore a separate out-of-band method is REQUIRED to indicate the bit rate (see section 6 for an example of signaling bit rate information using SDP). When operating at 24 kbit/s, 480 bits (60 octets) are produced per frame, and when operating at 32 kbit/s, 640 bits (80 octets) are produced per frame. Thus, both bit rates allow for octet alignment without the need for padding bits.

The number of bits within a frame is fixed, and within this fixed frame G.722.1 uses variable length coding (e.g. Huffman coding) to represent most of the encoded parameters [2]. All variable length codes are transmitted in order from the left most (most significant - MSB) bit to the right most (least significant - LSB) bit, see [2] for more details.

The use of Huffman coding means that it is not possible to identify the various coder parameters/fields contained within the bit stream without first completely decoding the entire frame.

For the purposes of packetizing the bit stream in RTP, it is only necessary to consider the sequence of bits as output by the G.722.1 encoder, and present the same sequence to the decoder. The payload format described here maintains this sequence.

Figure 3.1 illustrates how the G.722.1 bit stream MUST be mapped into an octet aligned RTP payload.

An RTP packet SHALL only contain G.722.1 frames of the same bit rate.

```

+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+

Figure 3.1  The G.722.1 encoder bit stream is split into a sequence of octets (60 or 80 depending on the bit rate), and each octet is in turn mapped into an RTP octet.

The ITU-T standardized bit rates for G.722.1 are 24 kbit/s and 32kbit/s. However, the coding algorithm itself has the capability to run at any user specified bit rate (not just 24 and 32kbit/s Â» see section 5 for further details on acceptable non-standard bit rate values) while maintaining an audio bandwidth of 50 Hz to 7 kHz.

When operating at non-standard rates the payload format SHOULD follow the guidelines illustrated in Figure 3.1. For example, a bit rate of 16.4 kbit/s will result in a frame of size 328 bits or 41 octets which are mapped into RTP per Figure 3.1.

4.1 Multiple G.722.1 frames in a RTP packet

More than one G.722.1 frame may be included in a single RTP packet by a sender.

Senders have the following additional restrictions:

- MUST not include more G.722.1 frames in a single RTP packet than will fit in the MTU of the RTP transport protocol.

- Frames MUST not be split between RTP packets.

It is RECOMMENDED that the number of frames contained within an RTP packet be consistent with the application. For example, in a telephony application where delay is important, then the fewer frames per packet the lower the delay, whereas for a delay insensitive streaming or messaging application, many frames per packet would be acceptable.

4.2 Computing the number of G.722.1 frames

Information describing the number of frames contained in an RTP packet is not transmitted as part of the RTP payload. The only way
to determine the number of G.722.1 frames is to count the total number of octets within the RTP packet, and divide the octet count by the number of expected octets per frame (either 60 or 80 per frame, for 24 kbit/s and 32 kbit/s respectively).

5. MIME registration of G.722.1

MIME media type name: audio
MIME subtype: g7221
Required parameters: None
Optional parameters:

  bitrate: the data rate for the audio bit stream. This parameter is necessary because the bit rate is not signaled within the G.722.1 bit stream. At the standard G.722.1 bit rates, the value MUST be either 24000 or 32000. If using the non-standard bit rates, then it is RECOMMENDED values in the range 16000 to 32000 be used, and that any value SHOULD be a multiple of 400 (this maintains octet alignment and does not then require (undefined) padding bits for each frame if not octet aligned).

  ptime: RECOMMENDED duration of each packet in milliseconds.

Published specification:
see ITU-T Recommendation G.722.1 for encoding algorithm details.

6. SDP usage of G.722.1

When conveying information by SDP [5], the encoding name SHALL be ‘g7221’ (the same as the MIME subtype). An example of the media representation in SDP might be:

m=audio 49000 RTP/AVP 121
a=rtpmap:121 g7221/16000
a=fmtp:121 bitrate=24000

where ‘bitrate’ is a variable that may take on values of 24000 or 32000 at the standard rates, or values from 16000 to 32000 (and SHOULD be an integer multiple of 400) at the non-standard rates.

7. Security Considerations

The registration procedure specified in this memo does not impose any security considerations on its own.
