TRILL OAM MIB
draft-deepak-trill-oam-mib-01.txt

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/1id-abstracts.txt.

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html.

This Internet-Draft will expire on November 08, 2013.

Abstract

This defines Management Information Base (MIB) for the IETF TRILL (Transparent Interconnection of Lots of Links) OAM objects.
1. Introduction

The general framework for TRILL OAM is specified in [TRILLOAMFRM]. The details of the Fault Management [FM] solution, conforming to that framework, are presented in [TRILLOAMFM]. The solution leverages the message format defined in Ethernet Connectivity Fault Management (CFM) [802.1Q] as the basis for the TRILL OAM message channel.

This document uses the CFM MIB modules defined in [802.1Q] as the basis for TRILL OAM MIB, and augments the existing tables to add new TRILL managed objects. The document further defines a new table with associated managed objects for TRILL OAM specific functionality.

2. The Internet-Standard Management Framework

For a detailed overview of the Internet-Standard Management Framework, please refer to [RFC3410]. Managed objects are accessed

</tbody>
</table>
via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the Structure of Management Information (SMI) specification. This memo specifies a MIB module that is compliant to SMIv2 [RFC2578], [RFC2579] and [RFC2580].

3. Overview

The TRILL-OAM-MIB module is intended to provide an overall framework for managing TRILL OAM. It leverages the IEEE8021-CFM-MIB and IEEE8021-CFM-V2-MIB modules defined in [802.1Q], and augments the Mep and Mep Db entries. It also adds a new table for TRILL OAM specific messages.

4. Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC-2119 [RFC2119].

5. Structure of the MIB module

Objects in this MIB module are arranged into subtrees. Each subtree is organized as a set of related objects. The various subtrees are shown below, supplemented with the required elements of the IEEE8021-CFM-MIB module.

5.1. Textual Conventions

Textual conventions are defined to represent object types relevant to the TRILL OAM MIB.

5.2. TRILL-OAM-MIB relationship to IEEE8021-TC-MIB

In TRILL, traffic labeling can be done using either a 12-bit VLAN or a 24-bit fine grain label.

IEEE8021-TC-MIB defines IEEE8021ServiceSelectorType with two values:

- 1 representing a vlanId, and
- 2 representing a 24 bit isid.

We propose to use value 2 for TRILL’s fine grain label. As such, TRILL-OAM-MIB will import IEEE8021ServiceSelectorType, IEEE8021ServiceSelectorValueOrNone, and IEEE8021ServiceSelectorValue from IEEE8021-TC-MIB.
5.3. TRILL OAM MIB Tree

TRILL-OAM-MIB

|--trillOamNotifications
   |--trillOamFaultAlarm

|--trillOamMibObjects

      |--trillOamPtrTable
      |--trillOamMtrTable
      |--trillOamMepDbTable

5.3.1. Notifications

Notification (fault alarm) is sent to the management entity with the OID of the MEP that has detected the fault.

5.3.2. TRILL OAM MIB Per MEP Objects

The TRILL OAM MIB Per MEP Objects are defined in the trillOamMepTable. The trillOamMepTable augments the dot1agCfmMepEntry (please see section 6.1) defined in IEEE8021-CFM-MIB. It includes objects that are locally defined for an individual MEP and its associated Flow.

5.3.2.1. trillOamMepTable Objects

- trillOamMepRName - This object contains the Rbridge Nickname as defined in RFC 6325 section 3.7.

- trillOamMepPtmTId - indicates the next sequence number/transaction identifier to be sent in a Path Trace message. The sequence number may be zero because it wraps around.

- trillOamMepNexttMtmTId - indicates the next sequence number/transaction identifier to be sent in a Multi-destination message. The sequence number may be zero because it wraps around.
around.

- `trillOamMepMepPtrIn` indicates the total number of valid, in-order, Path Trace Replies received.
- `trillOamMepPtrInOutofOrder` indicates the total number of valid, out-of-order, Path Trace Replies received.
- `trillOamMepPtrOut` indicates the total number of valid Path Trace Replies transmitted.
- `trillOamMepMtrIn` indicates the total number of valid, in-order, Multi-destination Replies received.
- `trillOamMepMtrInOutofOrder` indicates the total number of valid, out-of-order, Multi-destination Replies received.
- `trillOamMepMtrOut` indicates the total number of valid Multi-destination Replies transmitted.
- `trillOamMepTxLbmDestRName` indicates the target destination Rbridge NickName as defined in [RFC6325] section 3.7.
- `trillOamMepTxLbmHC` indicates the hop count field to be transmitted.
- `trillOamMepTxLbmReplyModeOob` True indicates that the Reply Mode of the Loopback message is requested to be out-of-band, and that the "Out of band IP address" TLV is to be transmitted. False indicates that in-band reply is transmitted.
- `trillOamMepTransmitLbmReplyIp` indicates the IP address to be transmitted in the "Out of band IP Address TLV" in the Loopback message.
- `trillOamMepTxLbmFlowEntropy` indicates the 128 bytes Flow entropy to be transmitted, as defined in [TRILLOAMFM].
- `trillOamMepTxPtmDestRName` indicates the target Destination Rbridge Nickname to be transmitted, as defined in [RFC6325] section 3.7.
- `trillOamMepTxPtmHC` indicates the hop count field to be transmitted.
- `trillOamMepTxPtmReplyModeOob` True indicates that the Reply Mode of the Path Trace message is requested to be out-of-band, and that the "Out of band IP address TLV" is to be transmitted.
False indicates that in-band reply is transmitted.

- `trillOamMepTransmitPtmReplyIP` - indicates the IP address to be transmitted in the "Out of band IP Address TLV" in the Path Trace message.

- `trillOamMepTransmitPtmFlowEntropy` - indicates the 128 bytes Flow entropy to be transmitted, as defined in [TRILLOAMFM].

- `trillOamMepTxPtmStatus` - A Boolean flag set to True by the MEP Path Trace Initiator State Machine or a MIB manager to indicate that another Path trace message is being transmitted. Reset to false by the MEP Initiator State Machine.

- `trillOamMepTxPtmResultOK` - Indicates the result of the operation, True: The Path Trace Message(s) will be (or has been) sent, False: The Path Trace Message(s) will not be sent.

- `trillOamMepTxPtmMessages` - The number of Path Trace messages to be transmitted.

- `trillOamMepTxPtmSeqNumber` - Indicates the Path Trace Transaction Identifier of the first PTM (to be) sent. The value returned is undefined if `trillOamMepTxPtmResultOK` is false.

- `trillOamMepTxMtmTree` - Indicates the Multi-destination Tree identifier as defined in RFC6325.

- `trillOamMepTxMtmHC` - Indicates the hop count field to be transmitted.

- `trillOamMepTxMtmReplyModeOob` - True indicates that the Reply of the Multi-destination message is requested to be out-of-band, and that the "Out of band IP address TLV" is to be transmitted. False indicates that in-band reply is transmitted.

- `trillOamMepTransmitMtmReplyIp` - the IP address to be transmitted in the "Out of band IP address TLV" in the Multi-destination message.

- `trillOamMepTxMtmFlowEntropy` - 128 Byte Flow Entropy to be transmitted, as defined in [TRILL-FM].

- `trillOamMepTxMtmStatus` - A Boolean flag set to True by the MEP Multi-Destination Initiator State Machine or a MIB manager to indicate that another Multicast trace message is being transmitted. Reset to False by the MEP Initiator State Machine.
5.3.2.2. trillOamMepFlowCfgTable Objects

Each row in this table represents a Flow Configuration Entry for the associated MEP. The table uses four indices. The first three indices are the indices of the Maintenance Domain, MaNet, and MEP tables. The fourth index is the specific Flow Configuration Entry on the selected MEP. Some write-able objects in this table are only applicable in certain cases (as described under each object below), and attempts to write values for them in other cases will be ignored.

- **trillOamMepFlowCfgIndex** - an index to the TRILL OAM Mep flow configuration table which indicates the specific Flow for the MEP. The index is never reused for other flow sessions on the same MEP while this session is active. The index value keeps increasing until it wraps to 0. This value can also be used in Flow-identifier TLV.

- **trillOamMepFlowCfgFlowEntropy** - This is 96 bytes of flow entropy as described in [TRILL-FM].

- **trillOamMepFlowCfgDestRname** - The target Rbridge nickname field to be transmitted as defined in [RFC6325] section 3.7.

- **trillOamMepFlowCfgFlowHC** - indicates the time to live field to be transmitted.

- **trillOamMepFlowCfgRowStatus** - indicates the status of row. The write-able columns in a row cannot be changed if the row is active. All columns MUST have a valid value before a row can be activated.

5.3.2.3. trillOamPtrTable Objects
Each row in the table represents a Path Trace Reply Entry for the defined MEP and Transaction. This table uses four indices. The first three indices identify the MEP and the fourth index specifies the Transaction Identifier, and this transaction identifier uniquely identifies the response for a MEP which can have multiple flow.

- `trillOamMepPtrTransactionId` - indicates Transaction identifier/sequence number returned by a previous transmit path trace message command, indicating which PTM’s response is going to be returned.
- `trillOamPtrHC` - indicates hop count field value for a returned PTR.
- `trillOamMepPtrFlag` - indicates FCOI field value for a returned PTR.
- `trillOamMepPtrErrorcode` - indicates the Return code and Return sub-code value for a returned PTR.
- `trillOamMepPtrTerminalMep` - indicates a Boolean value stating whether the forwarded PTM reached a MEP enclosing its MA, as returned in the Terminal MEP flag field.
- `trillOamMepPtrNextEgressIdentifier` - An integer field holding the last Egress Identifier returned in the PTR Upstream Rbridge nickname TLV of the PTR. The Last Egress identifies the Upstream Nickname.
- `trillOamMepPtrIngress` - The value returned in the Ingress Action field of the PTM. The value `ingNoTlv(0)` indicates that no Reply Ingress TLV was returned in the PTM.
- `trillOamMepPtrIngressMac` - indicates the MAC address returned in the ingress MAC address filed.
- `trillOamMepIngressPortIdSubtype` - indicates ingress Port ID. The format of this object is determined by the value of the `trillOamMepPtrIngressPortIdSubtype` object.
- `trillOamMepIngressPortId` - indicates the ingress port ID. The format of this object is determined by the value of the `trillOamMepPtrIngressPortId` object.
- `trillOamMepPtrEgressPortIdSubtype` - indicates the value returned in the Egress Action field of the PTM. The value `ingNoTlv(0)` indicates that no Reply Egress TLV was returned in the PTM.
5.3.2.4. **trillOamMtrTable Objects**

This table includes Multi-destination Reply managed objects. Each row in the table represents a Multi-destination Reply Entry for the defined MEP and Transaction. This table uses five indices: The first three indices are the indices of the Maintenance Domain, MaNet, and MEP tables. The fourth index is the specific Transaction Identifier on the selected MEP. The fifth index is the receive order of Multi-destination replies. Some writeable objects in this table are only applicable in certain cases (as described under each object below), and attempts to write a value for them in other cases will be ignored.

- **trillOamMepMtrTransactionId** - indicates Transaction identifier/sequence number returned by a previous transmit Multi-destination message command, indicating which MTM’s response is going to be returned.

- **trillOamMepMtrReceiveOrder** - indicates an index to distinguish among multiple MTR with same MTR Transaction Identifier field value. trillOamMepMtrReceiveOrder are assigned sequentially from 1, in the order that the Multi-destination Tree Initiator received the MTRs.
o trillOamMepMtrFlag - indicates FCOI field value for a returned MTR.

o trillOamMepMtrErrorCode - indicates return code and return sub code value for a returned MTR.

o trillOamMepMtrLastErrorIdentifier - indicates an integer field holding the Last Egress Identifier returned in the MTR Upstream Rbridge Nickname TLV of the MTR. The Last Egress Identifier identifies the Upstream Nickname.

o trillOamMepMtrIngress - indicates the value returned in the Ingress Action Field of the MTR. The value ingNoTLv(0) indicates that no Reply Ingress TLV was returned in the MTM.

o trillOamMepMtrIngressMac - indicates the MAC address returned in the ingress MAC address field.

o trillOamMepMtrIngressPortIdSubtype - indicates the ingress Port ID. The format of this object is determined by the value of the trillOamMepMtrIngressPortIdSubtype object.

o trillOamMepMtrIngressPortId - indicates the ingress Port Id. The format of this object is determined by the value of the trillOamMepMtrIngressPortId object.

o trillOamMepMtrEgress - indicates the value returned in the Egress Action field of the MTR. The value ingNoTLv(0) indicates that no Reply Egress TLV was returned in the MTR.

o trillOamMepMtrEgressMac - indicates the MAC address returned in the egress MAC address field.

o trillOamMepMtrEgressPortIdSubtype - indicates the egress Port ID. The format of this object is determined by the value of the trillOamMepMtrEgressPortIdSubtype object.

o trillOamMepMtrEgressPortId - indicates the egress port ID. The format of this object is determined by the value of the trillOamMepMtrEgressPortId object.

o trillOamMepMtrChassisIdSubtype - indicates the format of the chassis ID returned in the Sender ID TLV of the MTR, if any. The value is ignored if the trillOamMepMtrChassisId has length of 0.

o trillOamMepMtrChassisId - indicates the chassis ID returned in the Sender ID TLV of the MTR, if any. The format of this
object is determined by the value of the trillOamMepMtrChassisIdSubtype object.

- trillOamMepMtrOrganizationSpecificTlv - indicates all Organization specific TLVs returned in the MTR, if any. Includes all octets including and following the TLV length filed of each TLV, contacted together.

- trillOamMepMtrNextHopNicknames - indicates next hop Rbridge List TLV returned in the PTR, if any. Includes all octets including and following the TLV length filed of each TLV, concatenated together.

- trillOamMepMtrNextHopTotalReceivers - indicates value indicating that MTR response contains Multicast receiver availability TLV.

- trillOamMepMtrReceiverCount - indicates the number of Multicast receivers available on responding Rbridge on the VLAN specified by the diagnostic VLAN.

5.3.2.4. trillOamMepDbTable Objects

This table is an augmentation of the dot1agCfmMepDbTable, and rows are automatically added or deleted from this table based upon row creation and destruction of the dot1agCfmMepDbTable.

- trillOamMepDbFlowIndex - This object identifies the Flow. If the Flow Identifier TLV is received than index received can also be used.

- trillOamMepCfgFlowEntropy - indicates 96 bytes of Flow entropy.

- trillOamMepDbFlowState - indicates the operational state of the remote MEP (flow based) IFF state machines.

- trillOamMepDbRmepFailedOkTime - indicates the time (sysUpTime) at which the Remote Mep Flow State machine last entered either the RMEP_FAILED or RMEP_OK state.

- trillOamMepDbRbridgeName - indicates Remote MEP Rbridge Nickname.

6. Relationship to other MIB module

The IEEE8021-CFM-MIB, IEEE801-CFM-V2-MIB and LLDP-MIB contain
objects relevant to TRILL OAM MIB. Management objects contained in these modules are not duplicated here, to reduce overlap to the extent possible.

6.1. Relationship to IEEE8021-CFM-MIB

TRILL OAM MIB Imports the following management objects from IEEE8021-CFM-MIB:

- dot1agCfmMdIndex
- dot1agCfmMaIndex
- dot1agCfmMepIdentifier
- dot1agCfmMepEntry
- dot1agCfmMepDbEntry
- Dot1agCfmIngressActionFieldValue
- Dot1agCfmEgressActionFieldValue
- Dot1agCfmRemoteMepState

trillOamMepTable Augments dot1agCfmMepEntry. Implementation of IEEE-CFM-MIB is required as we are Augmenting the IEEE-CFM-MIB Table. Objects/Tables which are not applicable to TRILL implementation has to be handled by TRILL implementation back end and appropriate values as described in IEEE-CFM-MIB has to be returned.

6.2. MIB modules required for IMPORTS

The following MIB module IMPORTS objects from SNMPv2-SMI [RFC2578], SNMPv2-TC [RFC2579], SNMPv2-CONF [RFC2580], IEEE-8021-CFM-MIB, LLDP-MIB.

8. Security Considerations

This MIB relates to a system which will provide network connectivity and packet forwarding services. As such, improper manipulation of the objects represented by this MIB may result in denial of service to a large number of end-users.

There are number of management objects defined in this MIB module with a MAX-ACCESS clause of read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have negative effect on sensitivity/vulnerability are described below.

Some of the readable objects in this MIB module (i.e., objects with a MAC-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control event GET and/or NOTIFY access to these objects and possibly to event encrypt the values of these objects when sending them over the network via SNMP.

SNMP version prior to SNMPv3 did not include adequate security. Even
if the network itself is secure, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [RFC3410], section 8), including full support for the SNMPv3 cryptographic mechanism (for authentication and privacy).

Further, deployment of SNMP version prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

9. IANA Considerations

The MIB module in this document uses the following IANA-assigned OBJECT IDENTIFIER value recorded in the SMI Numbers registry:

<table>
<thead>
<tr>
<th>Descriptor</th>
<th>OBJECT IDENTIFIER value</th>
</tr>
</thead>
<tbody>
<tr>
<td>trillOamMIB</td>
<td>{ mib-2 xxx }</td>
</tr>
</tbody>
</table>

Editor’s Note (to be removed prior to publication): the IANA is requested to assign a value for "xxx" under the 'mib-2' subtree and to record the assignment in the SMI Numbers registry. When the assignment has been made, the RFC Editor is asked to replace "XXX" (here and in the MIB module) with the assigned value and to remove this note.
