Abstract

This document defines a Single Rate Three Color Marker (srTCM), which can be used as component in a Diffserv traffic conditioner [RFC2475, RFC2474]. The srTCM meters a traffic stream and marks its packets according to three traffic parameters, Committed Information Rate (CIR), Committed Burst Size (CBS), and Excess Burst Size (EBS), to be either green, yellow, or red. A packet is marked green if it doesn’t exceed the CBS, yellow if it does exceed the CBS, but not the EBS, and red otherwise.
1. Introduction

The Single Rate Three Color Marker (srTCM) meters an IP packet stream and marks its packets either green, yellow, or red. Marking is based on a Committed Information Rate (CIR) and two associated burst sizes, a Committed Burst Size (CBS) and an Excess Burst Size (EBS). A packet is marked green if it doesn’t exceed the CBS, yellow if it does exceed the CBS, but not the EBS, and red otherwise. The srTCM is useful, for example, for ingress policing of a service, where only the length, not the peak rate, of the burst determines service eligibility.

The Meter meters each packet and passes the packet and the metering result to the Marker:

```
+------------+   +--------+
|   Result   |   |        |
|            V
+-------+    +--------+
```

```
Packet Stream ===>| Meter |===>| Marker |===> Marked Packet Stream
+-------+    +--------+
```

The Meter operates in one of two modes. In the Color-Blind mode, the Meter assumes that the packet stream is uncolored. In the Color-Aware mode the Meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The details of the pre-coloring process, including handling of error scenarios, and how the Meter determines the color of a pre-colored packet are DS domain specific and outside the scope of this document.

The Marker (re)colors an IP packet according to the results of the Meter. The color is coded in the DS field [Nichols] of the packet in a PHB specific manner (see section 4 for an example).

A companion document [Heinanen1] describes another three color marker, called a Two Rate Three Color Maker (trTCM), where packets are marked based on two rates and two burst sizes.

2. Configuration

The srTCM is configured by setting its mode and by assigning values to three traffic parameters: a Committed Information Rate (CIR), a Committed Burst Size (CBS), and an Excess Burst Size (EBS).

The CIR is measured in bytes of IP packets per second, i.e., it
includes the IP header, but not link specific headers.

The CBS and the EBS are measured in bytes. The CBS and EBS MUST be configured so that at least one of them is larger than 0. It is RECOMMENDED that when the value of the CBS or the EBS is larger than 0, it is larger than or equal to the size of the largest possible IP packet in the stream.

3. Metering

The behavior of the Meter is specified in terms of its mode and two token buckets, C and E, which both share the common rate CIR. The maximum size of the token bucket C is CBS and the maximum size of the token bucket E is EBS.

The token buckets C and E are initially (at time 0) full, i.e., the token count \( T_c(0) = CBS \) and the token count \( T_e(0) = EBS \). Thereafter, the token counts \( T_c \) and \( T_e \) are updated CIR times per second as follows:

- If \( T_c \) is less than CBS, \( T_c \) is incremented by one, else
- If \( T_e \) is less than EBS, \( T_e \) is incremented by one, else
- neither \( T_c \) nor \( T_e \) is incremented.

When a packet of size \( B \) bytes arrives at time \( t \), the following happens if the srTCM is configured to operate in the Color-Blind mode:

- If \( T_c(t) - B \geq 0 \), the packet is green and \( T_c \) is decremented by \( B \) down to the minimum value of 0, else
- If \( T_e(t) - B \geq 0 \), the packet is yellow and \( T_e \) is decremented by \( B \) down to the minimum value of 0, else
- the packet is red and neither \( T_c \) nor \( T_e \) is decremented.

When a packet of size \( B \) bytes arrives at time \( t \), the following happens if the srTCM is configured to operate in the Color-Aware mode:

- If the packet has been precolored as green and \( T_c(t) - B \geq 0 \), the packet is green and \( T_c \) is decremented by \( B \) down to the minimum value of 0, else
- If the packet has been precolored as green or yellow and if \( T_e(t) - B \geq 0 \), the packets is yellow and \( T_e \) is decremented by \( B \)
down to the minimum value of 0, else

o the packet is red and neither Tc nor Te is decremented.

Note that according to the above rules, marking of a packet with a
given color requires that there be enough tokens of that color to
accommodate the entire packet. Other marking policies are clearly
possible. The above policy was chosen in order guarantee a
deterministic behavior where the volume of green packets is never
smaller than what has been determined by the CIR and CBS, i.e.,
tokens of a given color are always spent on packets of that color.

The actual implementation of a Meter doesn’t need to be modeled
according to the above formal specification.

4. Marking

The Marker reflects the metering result by setting the DS field of
the packet to a particular codepoint. In case of the AF PHB
[Heinanen2], the color can be coded as the drop precedence of the
packet.

5. Service Example

The srTCM can be used to mark a packet stream in a service, where
different, decreasing levels of assurances (either absolute or
relative) are given to packets which are green, yellow, or red. For
example, a service may discard all red packets, because they exceeded
both the committed and excess burst sizes, forward yellow packets as
best effort, and forward green packets with a low drop probability.

6. Security Concerns

The srTCM has no known security concerns.
