A Structural Object Class for Arbitrary Auxiliary Object Classes

Status of this Memo

This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of RFC2026.

This document is an Internet-Draft. Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months. Internet-Drafts may be updated, replaced, or made obsolete by other documents at any time. It is not appropriate to use Internet-Drafts as reference material or to cite them other than as a "working draft" or "work in progress".

To learn the current status of any Internet-Draft, please check the ietf-abstracts.txt listing contained in the Internet-Drafts Shadow Directories on ds.internic.net (US East Coast), nic.nordu.net (Europe), ftp.isi.edu (US West Coast), or munnari.oz.au (PacificRim).

Distribution of this document is unlimited.

Abstract

The Lightweight Directory Access Protocol (LDAP) supports auxiliary object classes for adding additional attributes to a directory entry.

This document defines a structural object class that may be used when no other structural object class is available.

1. Background
Schema for LDAP directories often define auxiliary object classes that are intended to be used with a specific structural object class.

For example, the posixGroup object class [RFC2307bis] is an auxiliary object class that may be used to overlay POSIX group identification on an existing group of distinguished names. In this case, it is suggested that the groupOfUniqueNames object class be used as a structural object class. However, this may sometimes be inappropriate: that groupOfUniqueNames requires at least one member may make it impossible to migrate existing group information. [RFC2307bis] could define a specific structural object class for this case (say, structuralPosixGroup), but this would unnecessarily add to the proliferation of redundant schema.

This document defines a structural object class, namedObject, that mandates no attributes other than a common name. Arbitrary auxiliary object classes may be thus associated with entries which have this as a structural object class.

2. Object Class Definitions

The namedObject object class defines one mandatory attribute, a common name. The OID arc is iso(1) org(3) dod(6) internet(1) private(4) enterprise(1) padl(5322) namedObjectSchema(13) objectClasses(1).

( 1.3.6.1.4.1.5322.13.1.1 NAME 'namedObject' SUP top STRUCTURAL MAY cn )

Other attributes allowed by auxiliary classes may be used for naming purposes.

An example entry would be:

    dn: cn=Sample Entry,dc=padl,dc=com
    objectClass: top
    objectClass: namedObject
    cn: Sample Entry

An example entry with an auxiliary class from [RFC2307bis] would be:

    dn: cn=wheel,ou=Groups,dc=padl,dc=com
    objectClass: top
    objectClass: namedObject
    objectClass: posixGroup
    cn: wheel
    gidNumber: 0
    memberUid: root
3. Security Considerations

The introduction of this schema element does not impact the security of the Internet. See [RFC2251] for general LDAP security considerations.

4. IANA Considerations

No IANA assignments are requested.

This document uses the OID 1.3.6.1.4.1.5322.13.1.1 to identity the namedObject schema element. This OID was assigned by PADL Software Pty Ltd under its IANA assigned private enterprise allocation for use in this specification.
