RTP Audio/Video Profile Interoperability Statement

draft-ietf-avt-profile-interop-06.txt

Abstract

It is required to demonstrate interoperability of implementations in order to move the RTP audio/video profile to draft standard. This memo outlines those features to be tested, as the first stage of an interoperability statement.

1 Introduction

The Internet standards process [1] places a number of requirements on a standards track protocol specification. In particular, when advancing a protocol from proposed standard to draft standard it
is necessary to demonstrate at least two independent and interoperable implementations, from different code bases, of all options and features of that protocol. Further, in cases where one or more options or features have not been demonstrated in at least two interoperable implementations, the specification may advance to the draft standard level only if those options or features are removed. The RTP Profile for Audio and Video Conferences with Minimal Control was originally specified in RFC1890 as a proposed standard [2]. The revision of this specification for draft standard status is now well underway, so it has become necessary to conduct such an interoperability demonstration.

This memo describes the set of features and options of the RTP Audio/Video profile which need to be tested as a basis for this demonstration.

This memo is for information only and does not specify a standard of any kind.

2 Features and options required to demonstrate interoperability

In order to demonstrate interoperability it is required to produce a statement of interoperability for each feature noted below. Such a statement should note the pair of implementations tested, including version numbers, and a pass/fail statement for each feature. It is not expected that every implementation will implement every feature, but each feature needs to be demonstrated by some pair of applications.

The RTP specification [3] enumerates a number of items that can be specified or modified by a profile. Those modified from the defaults by the audio/video profile are as follows, and interoperable behaviour must be demonstrated:

1. Exchange of RTCP packets with the default RTCP reporting interval.
   - PASS: rat, IP/TV

2. Exchange of RTCP packets with a modified RTCP reporting interval as selected by a different fraction of the session bandwidth (the means by which this interval is signalled are outside of the scope of this memo, but one such mechanism should be demonstrated).
   - PASS: IP/TV, rtplib

3. Implementations must send RTCP packets containing an SDES CNAME in every reporting interval.
   - PASS: rat, IP/TV
4. Other SDES items must be sent every third interval, with NAME
every 7 of 8 times within that slot and any other SDES items
cyclically taking up the 8th slot.
   o PASS: rat, IP/TV

5. Interoperable selection of ‘pass phrase’ for encryption and exchange
of media using DES encryption. This must include mapping of
the pass phrase to the canonical form.
   o FAIL: NeVoT does this, need to test...

6. Interoperable transport of RTP via unicast UDP
   o PASS: rat, vat, vic, IP/TV

7. Interoperable transport of RTP via multicast UDP
   o PASS: rat, vat, vic, IP/TV

8. Interoperable transport of RTP via TCP using the encapsulation
defined in section 7 of [2].
   o FAIL: Real have it?

The primary purpose of the audio/video profile is to define the mapping
from payload format to payload type number. Accordingly, the majority
of the work needed to demonstrate interoperability consists of testing
that media data is exchanged in an interoperable manner using the
full range of codecs enumerated in the profile.

The following codecs are assigned static payload types. It should
be verified that interoperable implementations exist for each static
payload type:

1. The 8kHz PCMU codec (payload type 0)
   o PASS: rat, vat, fphone, IP/TV, Nuera.

2. The 8kHz 1016 codec (payload type 1)
   o FAIL

3. The 8kHz G726-32 codec (payload type 2)
   o PASS: rat vs Ericsson (tested by Magnus Westerlund)

4. The 8kHz GSM codec (payload type 3)
   o PASS: rat, vat, fphone, IP/TV
5. The 8kHz G723 codec (payload type 4)
   o PASS: AudioCodes has performed Interoperability of its G.723.1
coder with Microsoft NetMeeting, Telogy (a TI company), VocalTec
as well as several other companies (reported by Yehuda Herskovitz).
   o PASS: Also implementations by Nuera, Meridian 1 ITG, BCM
and Matra 6500, Microsoft Netmeeting, Cisco. (Reported by
Tom Taylor).
   o PASS: Nortel Meridian ITG with Acer, Arelnet, Cisco IOS gateway,
CU-SeeMe (MCU and endpoint), Dataconnection (MCU and endpoint),
Delta Information Systems, First Virtual Corporation, Intel
Internet Phone, Avaya Definity, Lucent Alchemy, Microsoft
Netmeeting, Radcom, Radvision L2W Gateway, Samsung Si, Sony
Contact. Nortel Business Communication Manager and Nortel
Matra 6500 would have similar interoperability list.

6. The 8kHz DVI4 codec (payload type 5)
   o PASS: rat, vat, fphone, IP/TV

7. The 16kHz DVI4 codec (payload type 6)
   o PASS: QuickTime vs rat

8. The 8kHz LPC codec (payload type 7)
   o PASS: rat, vat, fphone

9. The 8kHz PCMA codec (payload type 8)
   o PASS: Nuera with Lucent

10. The 8kHz G722 codec (payload type 9)
   o PASS: Accord have tested with Polycom, VCON and PictureTel.
RealAudio have an implementation, also.

11. The 44.1kHz stereo L16 codec (payload type 10)
   o PASS: RealNetworks with QuickTime

12. The 44.1kHz mono L16 codec (payload type 11)
   o PASS: RealNetworks with QuickTime

13. The 8kHz QCELP codec (payload type 12)
   o PASS: RealNetworks with QuickTime

14. The 8kHz CN codec (payload type 13)
   o RESERVED: no need to test for now?
15. The MPA codec (payload type 14)
   o PASS: IP/TV, PixStream, Minerva, LiveCaster

16. The 8kHz G728 codec (payload type 15)
   o PASS: Accord have tested with Polycom, VCON and PictureTel.
     Nuera have an implementation, also.

17. The 11.025kHz DVI4 codec (payload type 16)
   o PASS: QuickTime vs rat

18. The 22.050kHz DVI4 codec (payload type 17)
   o PASS: QuickTime vs rat

19. The 8kHz G729 codec (payload type 18)
   o PASS: Nuera vs Cisco, Nortel, VegaStream (SIP Bakeoff 5)

The following codecs use dynamic payload types. It should be verified
that some non-RTP means can be used to assign a dynamic payload type
to be used by implementations, and that those implementations can
then interwork.

1. The GSM-HR codec
   o FAIL: Cisco have an impl? Dinesh Nambisan (dineshn@cisco.com)

2. The GSM-EFR codec
   o PASS: Tested implementations by Magnus Westerlund at Ericsson
     and Ari Lakaniemi at Nokia. Also implementations by Nuera
     (Maroula Bratakos <mbratakos@nuera.com>) and Cisco (Ling
     Niu) exist.

3. The L8 codec
   o PASS: RealNetworks with QuickTime

4. The RED codec
   o PASS: rat, fphone

5. The VDVI codec
   o PASS: rat, fphone
Similarly, interoperable implementation of the following video codecs with static payload type numbers must be demonstrated:

1. The CellB codec (payload type 25)
   - PASS: JMF 2.1, VIC 2.8-1.1.3 from UCL, ShowMeTV, NV

2. The JPEG codec (payload type 26)
   - PASS: ShowMeTV, Quicktime, vic.

3. The nv codec (payload type 28)
   - PASS: nv and vic (confirmed by Ron Frederick)

4. The H261 codec (payload type 31)
   - PASS: IP/TV, vic, VCON, Polycom

5. The MPV codec (payload type 32)
   - PASS: IP/TV, PixStream, Minerva

6. The MP2T codec (payload type 33)
   - PASS: Cisco have a pre-release implementation which receives from the Optibase Media GateWay 3100 v1.0 (Humphrey Liu <hcliu@cisco.com>). Sun also have an implementation, and are willing to test (Jonathan Sergent <sergent@eng.sun.com>)

7. The H263 codec (payload type 34)
   - PASS: PictureTel with Vtel, Polycom, etc. (Lulin Chen)

The following codecs use dynamic payload types. It should be verified that some non-RTP means can be used to assign a dynamic payload type to be used by implementations, and that those implementations can then interwork.

1. The BT656 codec
   - FAIL: Cabo has an implementation

2. The H263-1998 codec
   - PASS: RealNetworks with QuickTime

3. The MP1S codec
   - FAIL: quicktime has it, anyone else? 2NetFX? Optivision?

4. The MP2P codec
   - FAIL: quicktime has it, anyone else? 2NetFX? Optivision?
5. The BMPEG codec

- FAIL

Implementations must also demonstrate interoperable use of the marker bit. That is, the M bit is set on the first packet of each talkspurt for audio and on the last packet of each frame for video.
