Abstract

This document defines a data model for the Babel routing protocol. The data model is defined using the YANG data modeling language.

Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119][RFC8174] when, and only when, they appear in all capitals, as shown here..

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 6, 2019.

1. Introduction

This document defines a data model for the Babel routing protocol [I-D.ietf-babel-rfc6126bis]. The data model is defined using YANG 1.1 [RFC7950] data modeling language and is Network Management Datastore Architecture (NDMA) [RFC8342] compatible. It is based on the Babel Information Model [I-D.ietf-babel-information-model].

1.1. Note to RFC Editor

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements and remove this note before publication.

- "XXXX" --> the assigned RFC value for this draft both in this draft and in the YANG models under the revision statement.

- "ZZZZ" --> the assigned RFC value for Babel Information Model [I-D.ietf-babel-information-model]
1.2. Definitions and Acronyms

1.3. Tree Diagram

For a reference to the annotations used in tree diagrams included in this draft, please see YANG Tree Diagrams [RFC8340].

2. Babel Module

This document defines a YANG 1.1 [RFC7950] data model for the configuration and management of Babel. The YANG module is based on the Babel Information Model [I-D.ietf-babel-information-model].

2.1. Information Model

The following diagram illustrates a top level hierarchy of the model. In addition to information like the version number implemented by this device, the model contains subtrees on constants, interfaces, routes and security.
module: ietf-babel
    augment /rt:routing/rt:control-plane-protocols
        /rt:control-plane-protocol:
            +++-rw babel!
                +++-ro version?                  string
                +++-rw enable?                   boolean
                +++-ro router-id                 binary
                +++-rw link-type*                identityref
                +++-ro sequence-number?          uint16
                +++-rw metric-comp-algorithms*   identityref
                +++-rw security-supported*       identityref
                +++-rw hmac-enable?              boolean
                +++-rw hmac-algorithms*          identityref
                +++-rw dtls-enable?              boolean
                +++-rw dtls-cert-types*          identityref
                +++-rw stats-enable?             boolean
                +++-rw constants
                    | ...                          ...
                +++-rw interfaces* [reference]
                    | ...                          ...
                +++-rw hmac* [algorithm]
                    | ...                          ...
                +++-rw dtls* [name]
                    ...                          ...
            augment /rt:routing/rt:ribs/rt:rib/rt:routes/rt:route:
                +++-ro routes* [prefix]
                    +++-ro prefix                inet:ip-prefix
                    +++-ro router-id?            binary
                    +++-ro neighbor?             leafref
                    +++-ro (metric)
                        | ...                          ...
                    +++-ro seqno?                uint16
                    +++-ro next-hop?             inet:ip-address
                    +++-ro feasible?             boolean
                    +++-ro selected?             boolean

The interfaces subtree describes attributes such as interface object that is being referenced, the type of link as enumerated by Babel Link Types, and whether the interface is enabled or not.

The constants subtree describes the UDP port used for sending and receiving Babel messages, and the multicast group used to send and receive announcements on IPv6.

The routes subtree describes objects such as the prefix for which the route is advertised, a reference to the neighboring route, and next-hop address.
Finally, for security two subtrees are defined. The hmac subtree which refers to parameters related to HMAC security mechanism. The boolean flag apply-all indicates whether HMAC mechanism is applicable for all interfaces or just for interfaces listed in the leaf-list ‘interfaces’. The dtls subtree refers to parameters related to DTLS security mechanism. Similar to the HMAC mechanism, the boolean flag apply-all indicates whether DTLS mechanism is applicable for all interfaces or just for interfaces listed in the leaf-list ‘interfaces’.

2.2. YANG Module

This module augments A YANG Data Model for Interface Management [RFC8343], YANG Routing Management [RFC8349], and imports definitions from Common YANG Data Types [RFC6991].

module: ietf-babel
    augment /rt:routing/rt:control-plane-protocols

3. IANA Considerations

This document registers one URIs and one YANG module.

3.1. URI Registrations

3.2. YANG Module Name Registration

This document registers one YANG module in the YANG Module Names registry YANG [RFC6020].

Name: ietf-babel
prefix: babel
reference: RFC XXXX

4. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocol such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer and the mandatory-to-implement secure transport is SSH [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The NETCONF Access Control Model (NACM [RFC8341]) provides the means to restrict access for particular NETCONF users to a pre-configured subset of all available NETCONF protocol operations and content.

There are a number of data nodes defined in the YANG module which are writable/created/deleted (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., <edit-config>) to these data nodes without proper protection can have a negative effect on network operations.
These are the subtrees and data nodes and their sensitivity/vulnerability:
