Abstract

For operational simplification of "sessionless" applications using BFD, in this document we present procedures for "unsolicited BFD" that allow a BFD session to be initiated by only one side, and be established without explicit per-session configuration or registration by the other side (subject to certain per-interface or per-router policies).

Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" are to be interpreted as described in [RFC2119] only when they appear in all upper case. They may also appear in lower or mixed case as English words, without normative meaning.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on August 29, 2019.
1. Introduction

The current implementation and deployment practice for BFD ([RFC5880] and [RFC5881]) usually requires BFD sessions be explicitly configured or registered on both sides. This requirement is not an issue when an application like BGP ([RFC4271]) has the concept of a "session" that involves both sides for its establishment. However, this requirement can be operationally challenging when the prerequisite "session" does not naturally exist between two endpoints in an application. Simultaneous configuration and coordination may be required on both sides for BFD to take effect. For example:

- When BFD is used to keep track of the "liveness" of the nexthop of static routes. Although only one side may need the BFD functionality, currently both sides need to be involved in specific configuration and coordination and in some cases static routes are created unnecessarily just for BFD.
- When BFD is used to keep track of the "liveness" of the third-party nexthop of BGP routes received from the Route Server ([RFC7947]) at
an Internet Exchange Point (IXP). As the third-party nexthop is different from the peering address of the Route Server, for BFD to work, currently two routers peering with the Route Server need to have routes and nexthops from each other (although indirectly via the Router Server), and the nexthop of each router must be present at the same time. These issues are also discussed in [I-D.ietf-idr-rs-bfd].

Clearly it is beneficial and desirable to reduce or eliminate unnecessary configurations and coordination in these "sessionless" applications using BFD.

In this document we present procedures for "unsolicited BFD" that allow a BFD session to be initiated by only one side, and be established without explicit per-session configuration or registration by the other side (subject to certain per-interface or per-router policies).

With "unsolicited BFD" there is potential risk for excessive resource usage by BFD from "unexpected" remote systems. To mitigate such risks, several mechanisms are recommended in the Security Considerations section.

Compared to the "Seamless BFD" [RFC7880], this proposal involves only minor procedural enhancements to the widely deployed BFD itself. Thus we believe that this proposal is inherently simpler in the protocol itself and deployment. As an example, it does not require the exchange of BFD discriminators over an out-of-band channel before the BFD session bring-up.

When BGP Add-Path [RFC7911] is deployed at an IXP using the Route Server, multiple BGP paths (when exist) can be made available to the clients of the Router Server as described in [RFC7947]. The "unsolicited BFD" can be used in BGP route selection by these clients to eliminate paths with "inaccessible nexthops".

2. Procedures for Unsolicited BFD

With "unsolicited BFD", one side takes the "Active role" and the other side takes only the "Passive role" as described in [RFC5880].

On the passive side, the "unsolicited BFD" SHOULD be configured explicitly on an interface. The BFD parameters can be either per-interface or per-router based. It MAY also choose to use the parameters that the active side uses in its BFD Control packets. The "Discriminator", however, MUST be chosen to allow multiple unsolicited BFD sessions.
The active side initiates the BFD Control packets as specified in [RFC5880]. The passive side does not initiate the BFD Control packets.

When the passive side receives a BFD Control packet from the active side with 0 as the "remote-discriminator", and it does not find an existing session with the same source address as in the packet and "unsolicited BFD" is allowed on the interface by local policy, it SHOULD then create a matching BFD session toward the active side (based on the source address and destination address in the BFD Control packet) as if the session were locally registered. It would then start sending the BFD Control packets and perform necessary procedure for bringing up, maintaining and tearing down the BFD session. If the BFD session fails to get established within certain specified time, or if an established BFD session goes down, the passive side would stop sending BFD Control packets and delete the BFD session created until the BFD Control packets is initiated by the active side again.

The "Passive role" may change to the "Active role" when a local client registers for the same BFD session, and from the "Active role" to the "Passive role" when there is no longer any locally registered client for the BFD session.

3. YANG Data Model

This section extends the YANG data model for BFD [I-D.ietf-bfd-yang] to cover the unsolicited BFD.

3.1. Unsolicited BFD Hierarchy
module: ietf-bfd-unsolicited
  augment /rt:routing/rt:control-plane-protocols
  /rt:control-plane-protocol/bfd:bfd:
    ++-rw unsolicited {bfd-unsol:unsolicited-params-global}?
      ++-rw allow? boolean
      ++-rw local-multiplier? multiplier
    ++-rw (interval-config-type)?
      +++-(tx-rx-intervals)
        | ++-rw desired-min-tx-interval? uint32
        | ++-rw required-min-rx-interval? uint32
      +++-(single-interval) {single-minimum-interval}?
        ++-rw min-interval? uint32
  augment /rt:routing/rt:control-plane-protocols
  /bfd-ip-sh:interfaces:
    ++-rw unsolicited {bfd-unsol:unsolicited-params-per-interface}?
      ++-rw allow? boolean
      ++-rw local-multiplier? multiplier
    ++-rw (interval-config-type)?
      +++-(tx-rx-intervals)
        | ++-rw desired-min-tx-interval? uint32
        | ++-rw required-min-rx-interval? uint32
      +++-(single-interval) {single-minimum-interval}?
        ++-rw min-interval? uint32
  augment /rt:routing/rt:control-plane-protocols
  /bfd-ip-sh:sessions/bfd-ip-sh:session:
    ++-ro unsolicited
    ++-ro role? bfd-unsol:unsolicited-role

"CODE ENDS"
4. IANA Considerations

This documents makes no IANA requests.

5. Security Considerations

The same security considerations as those described in [RFC5880] and [RFC5881] apply to this document. With "unsolicited BFD" there is potential risk for excessive resource usage by BFD from "unexpected" remote systems. To mitigate such risks, the following measures are RECOMMENDED:

- Limit the feature to specific interfaces, and to a single-hop BFD with "TTL=255" [RFC5082]. In addition make sure the source address of an incoming BFD packet belongs to the subnet of the interface from which the BFD packet is received.
- Apply "access control" to allow BFD packets only from certain subnets or hosts.
- Deploy the feature only in certain "trustworthy" environment, e.g., at an IXP, or between a provider and its customers.
- Adjust BFD parameters as needed for the particular deployment and scale.
- Use BFD authentication.
