Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/1id-abstracts.txt
The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html.

Abstract

This memo defines the Management Information Base (MIB) objects in order to manage traffic engineering database (TED) information with extension in support of Multi-Protocol Label Switching (MPLS) with traffic engineering (TE) as well as Generalized MPLS (GMPLS) for use with network management protocols.

1. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

2. Introduction

The OSPF MIB was originally defined for OSPF version2 in support of IPv4 [RFC4750] and extended to support the Internet Protocol version6 (IPv6) as OSPF version3 MIB [RFC5643]. The ISIS MIB is also defined as [RFC4444]. On the other side, MPLS/GMPLS based traffic engineering has so far extended OSPF/ISIS routing protocol with TE functionality [RFC4202], [RFC3630], [RFC5329], [RFC5307] and [RFC5305]. To manage such MPLS-TE/GMPLS networks effectively, routing information associated with MPLS/GMPLS TE parameters (TED) is preferred for the network management; however, there is no clear definition of MPLS/GMPLS TE information in existing MIBs related to OSPF(v2 and v3)/ISIS.

This memo defines the Management Information Base (MIB) objects for managing TED in support of MPLS-TE/GMPLS for use with network management protocols.

This MIB module should be used in conjunction with OSPFv2 MIB, OSPF v3 MIB and ISIS MIB as well as other MIBs defined in [RFC3812], [RFC3813], [RFC4802] and [RFC4803] for the management of MPLS/GMPLS based traffic engineering information. By implementing such MIB modules, it is helpful to simultaneously understand entire MPLS/GMPLS network such as routing information as well as LSP information using a management system. But, note that this MIB module is able to be implemented and performed without implementation of other MIB modules when the management system, for example, only comprehends MPLS/GMPLS topology information such as TE link information.

3. Overview

3.1 Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC-2119 [RFC2119].
3.2 Terminology

Definitions of key terms for MPLS OAM and GMPLS are found in [RFC4377] and [RFC3945], and the reader is assumed to be familiar with those definitions which are not repeated here.

3.3 Acronyms

GMPLS: Generalized Multi-Protocol Label Switching
ISIS: Intermediate System to Intermediate System
LSA: Link state advertisement
LSP: Label Switching Path
LSR: Label Switching Router
MIB: Management Information Base
OSPF: Open Shortest Path First
PSC: Packet Switch Capable
SRLG: Shared Risk Link Group
TE: Traffic Engineering
TED: Traffic Engineering Database
TDM: Time Division Multiplexing

4. Motivations

The existing OSPFv2, OSPFv3, ISIS, MPLS and GMPLS MIBs do not provide for the management interface to retrieve topology information of MPLS and GMPLS networks.

5. Brief Description of MIB Modules

The objects described in this section support the management of TED described in [RFC4202], [RFC4203] and [RFC5307] for GMPLS extensions as well as in [RFC3630] and [RFC5305] for MPLS/GMPLS.

5.1 tedTable

The tedTable is basically used to indicate TED information of OSPF-TE or ISIS-TE. However, this table does not contain information for Local/Remote interface IP address, Interface Switching Capability Descriptor and Shared Risk Link Group information within the sub-TLVs for the Link-TLV.

5.2 tedLocalIfAddrTable

The tedLocalIfAddrTable is identical to the Local interface IP address information in a sub-TLV for the Link-TLV. This is independently defined, because the Interface IP Address sub-TLV may appear more than once within the same Link-TLV.

5.3 tedRemoteIfAddrTable

The tedRemoteIfAddrTable is identical to the Remote interface IP address information in a sub-TLV of the Link-TLV. This is independently defined, because the Interface IP Address sub-TLV may appear more than once with the same Link-TLV.
5.4 tedSwCapTable

The tedSwCapTable is identical to the Interface Switching Capability Descriptor information in a sub-TLV of Link-TLV. This is independently defined, because the Interface Switching Capability Descriptor sub-TLV may appear more than once with the same Link-TLV.

5.5 tedSrlgTable

The tedSrlgTable is identical to the Shared Risk Link Group information in a sub-TLV of Link-TLV. Think is independently defined, because the Shared Risk Link Group sub-TLV may appear more than once with the same Link-TLV.

6. Example of the TED MIB Module Usage

In this section, we provide an example of the TED MIB module usage. The following indicates the information of a numbered TE link originated in a GMPLS controlled node. When TE link information is retrieved in a MPLS network, GMPLS specific objects such as tedLocalIfAddrTable, tedRemoteIfAddrTable, tedSwCapTable and tedSrlgTable are not supported.

By retrieval of such information periodically, the management system can comprehend the detailed topology information related to MPLS/GMPLS networks. In particular, the basic TED information can be collected by tedTable, local/remote interface IP address information related to MPLS/GMPLS network are collected by tedLocalIfAddrTable and tedRemoteIfAddrTable. And the attribute information related to GMPLS TE link can be retrieved by tedSwCapTable and tedSrlgTable. Regarding a fault management, there is no functionality to notify network failures in this MIB module. But, if network topologies are changed, the module can notify the change information to the management system by using tedStatusChange, tedEntryCreated and tedEntryDeleted.

Note that the TED MIB modules are only limited to "read-only" access except for tedCreatedDeletedNotificationMaxRate and tedStatusChangeNotificationMaxRate. The TED MIB module is designed to be independent of OSPF or ISIS MIBs, however each TE link information belongs to a node or a link which is managed by the routing protocol.

In tedTable:
{
  tedLinkInformationData.2.3232235777.3232235778.16777264 zeroDotZero
  tedLinkType.2.3232235777.3232235778.16777264 pointToPoint(1)
  tedLinkState.2.3232235777.3232235778.16777264 up(1)

Security Consideration

There are several objects defined in this MIB module that has a MAX-ACCESS clause of read-write. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability: tedTable, tedLocalIfAddrTable, tedRemoteIfAddrTable, tedSwCapTable and tedSrlgTable contain topology information for the MPLS/GMPLS network. If an administrator does not want to reveal this information, then these tables should be considered sensitive/vulnerable.

There are only two write-access objects in this MIB module: tedStatusChangeNotificationMaxRate and tedCreatedDeletedNotificationMaxRate. Malicious modification of these objects could cause the management agent, the network, or the router to become overloaded with Notifications in cases of high churn within the network.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPsec), even then, there is no control as to who on the secure network is allowed
to access and GET/SET (read/change/create/delete) the objects in this MIB module.

Implementations MUST provide the security features described by the SNMPv3 framework (see [RFC3410]), including full support for authentication and privacy via the User-based Security Model (USM) [RFC3414] with the AES cipher algorithm [RFC3826]. Implementations MAY also provide support for the Transport Security Model (TSM) [RFC5591] in combination with a secure transport such as SSH [RFC5592] or TLS/DTLS [RFC6353]. Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principles (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

9. IANA Considerations

The following "IANA Considerations" subsection requests IANA for a new assignment under the transmission subtree. New assignments can only be made via a Standards Action as specified in [RFC5226].

9.1 IANA Considerations for TED-MIB

The IANA is requested to assign {transmission yyy} to the TED-MIB module specified in this document.
