A YANG Data Model for Layer 0 Types
draft-ietf-ccamp-layer0-types-03

Abstract

This document defines a collection of common data types and groupings in the YANG data modeling language. These derived common types and groupings are intended to be imported by modules that model Layer 0 optical Traffic Engineering (TE) configuration and state capabilities such as Wavelength Switched Optical Networks (WSONs) and Flexi-grid Dense Wavelength Division Multiplexing (DWDM) Networks.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on May 31, 2020.

1. Introduction

YANG [RFC6020] and [RFC7950] is a data modeling language used to model configuration data, state data, Remote Procedure Calls, and notifications for network management protocols such as NETCONF [RFC6241]. The YANG language supports a small set of built-in data types and provides mechanisms to derive other types from the built-in types.

This document introduces a collection of common data types derived from the built-in YANG data types. The derived types and groupings are designed to be the common types applicable for modeling Traffic Engineering (TE) features as well as non-TE features (e.g., physical network configuration aspect) for Layer 0 optical networks in model(s) defined outside of this document. The applicability of Layer 0 types specified in this document include Wavelength Switched Optical Networks (WSONs) [RFC6163] and [ITU-Tg6982], and Flexi-grid Dense Wavelength Division Multiplexing (DWDM) Networks [RFC7698] and [ITU-Tg6941].
1.1. Terminology and Notations

Refer to [RFC7446] and [RFC7581] for the key terms used in this document, and the terminology for describing YANG data models can be found in [RFC7950].

The YANG data model in this document conforms to the Network Management Datastore Architecture defined in [RFC8342].

1.2. Prefix in Data Node Names

In this document, names of data nodes and other data model objects are prefixed using the standard prefix associated with the corresponding YANG imported modules.

<table>

Note: The RFC Editor will replace XXXX with the number assigned to the RFC once this document becomes an RFC.

YANG module ietf-layer0-types (defined in Section 3) references [RFC6163], [RFC7205], and [RFC7698].

2. Overview

This document defines YANG module for common Layer 0 types, ietf-layer0-types. This module is used for WSXN and Flexi-grid DWDM networks.

2.1. Layer 0 Types Module Contents

The ietf-layer0-types module contains the following YANG reusable types and groupings:

Operational-mode:

A type that represents operational mode as defined in [ITU-Tg6982].

layer0-node-type:

A base YANG identity for supported node type as defined in [RFC6163].
wavelength-assignment:

A base YANG identity for allocated wavelength assignment type as defined in [RFC6163].

layer0-grid-type:

A base YANG identity for the grid type as defined in [RFC6163] and [RFC7698].

term-type:

A base YANG identity for the supported termination type as defined in [ITU-Tg709].

layer0-bandwidth-type:

A base YANG identity for the layer0 bandwidth type as defined in [ITU-Tg709].

dwdm-ch-spc-type:

A base YANG identity for the DWDM channel spacing type as defined in [RFC6205].

cwdm-ch-spc-type:

A base YANG identity for the CWDM channel spacing type as defined in [RFC6205].

FEC-type:

A base YANG identity for the FEC type as defined in [ITU-Tg709].

wson-path-bandwidth:

A YANG grouping that defines the WSON path bandwidth attributes as defined in [RFC6163].

wson-link-bandwidth:

A YANG grouping that defines WSON link bandwidth attributes as defined in [RFC6163].

wson-label-start-end:

A YANG grouping that defines the label-start and label-end for WSON as defined in [RFC6205].
wson-label-hop:

A YANG grouping that defines the label hop for WS0N as defined in [RFC6205].

layer0-label-range-info:

A YANG grouping that defines the layer 0 label range information applicable for both WSON per priority level as defined in [RFC6205]. This grouping is used in the flexi-grid DWDM by adding more flexi-grid-specific parameters.

wson-label-step:

A YANG grouping that defines label steps for WSON as defined in [I-D.ietf-teas-yang-te-types].

flexi-grid-node-attributes:

A YANG grouping that defines flexi-grid node attributes as defined in [RFC7698].

flexi-grid-path-bandwidth:

A YANG grouping that defines flexi-grid path bandwidth attributes as defined in [RFC7698].

flexi-grid-link-bandwidth:

A YANG grouping that defines flexi-grid link bandwidth attributes as defined in [RFC7698].

flexi-grid-label-start-end:

A YANG grouping that defines the label-start and label-end for flexi-grid as defined in [RFC7698].

flexi-grid-channel:

A YANG grouping that defines flexi-grid channel as defined in [RFC7698].

flexi-grid-label-hop:

A YANG grouping that defines the label hop for both single channel and multiple carriers in flexi-grid DWDM, as defined in [RFC7698].

flexi-grid-label-range-info:
A YANG grouping that defines flexi-grid label range information and per priority level as defined in [RFC7698] and [RFC8363].

flexi-grid-label-step:

A YANG grouping that defines flexi-grid label steps as defined in [I-D.ietf-teas-yang-te-types].

    description "Minimum space between slot widths. Default is 12.500 GHz";
    reference "RFC7698: Framework and Requirements for GMPLS-Based Control of Flexi-Grid Dense Wavelength Division Multiplexing (DWDM) Networks";
  }
  leaf min-slot-width-factor {
    type uint16 {
      range "1..max";
    }
    default 1;
    description "Minimum slot width is calculated by:
              Minimum slot width (GHz) = min-slot-width-factor * slot-width-granularity";
    reference "RFC8363: GMPLS OSPF-TE Extensions in Support of Flexi-Grid Dense Wavelength Division Multiplexing (DWDM) Networks";
  }
  leaf max-slot-width-factor {
    type uint16 {
      range "1..max";
    }
  }
}
Max-step-width is calculated by:

\[ \text{Max-slot-width (GHz)} = \text{max-slot-width-factor} \times \text{slot-width-granularity} \]

4. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The NETCONF access control model [RFC8341] provides the means to restrict access for particular NETCONF users to a preconfigured subset of all available NETCONF protocol operations and content. The NETCONF Protocol over Secure Shell (SSH) [RFC6242] describes a method for invoking and running NETCONF within a Secure Shell (SSH) session.
as an SSH subsystem. The NETCONF access control model [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

The YANG module in this document defines optical layer0 type definitions (i.e., typedef, identity and grouping statements) in YANG data modeling language to be imported and used by other layer 0 specific modules. When imported and used, the resultant schema will have data nodes that can be writable, or readable. The access to such data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations.

The security considerations spelled out in the YANG 1.1 specification [RFC7950] apply for this document as well.

5. IANA Considerations

It is proposed that IANA should assign new URIs from the "IETF XML Registry" [RFC3688] as follows:

Registrant Contact: The IESG
XML: N/A; the requested URI is an XML namespace.

This document registers following YANG modules in the YANG Module Names registry [RFC7950].

name: ietf-layer0-types
prefix: layer0-types
reference: RFC XXXX(TBD)

6. Acknowledgements

The authors and the working group give their sincere thanks for Robert Wilton for the YANG doctor review, and Tom Petch for his comments during the model and document development.
