IANA Registration for Enumservice 'iax'  
draft-ietf-enum-iax-10

Abstract

This document registers an Enumservice for the IAX protocol according to the guidelines given in RFC 6117.

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 29, 2011.

1. Introduction

The E.164 to Uniform Resource Identifiers (URI) [RFC3986] Dynamic Delegation Discovery System (DDDS) Application (ENUM) [RFC6116] transforms E.164 [E164] numbers into URIs using the Domain Name System (DNS) [RFC1035].

IAX (Inter-Asterisk eXchange) [RFC5456] is an "all in one" protocol for handling multimedia in IP networks. It combines both control and media services in the same protocol.

This document registers an Enumservice for the IAX [RFC5456] protocol according to the guidelines given in [RFC6117].

2. IANA Registration

[Note for RFC-Editor: Please replace any instance of rfcTHIS with the RFC number of this document before publication]
<record>

3. Examples

The following examples are just for illustrative purposes and will in no way limit the usage of the ‘iax’ Enumservice to other usage scenarios.

3.1. Simple IAX URI

The following NAPTR resource record is an example of the ‘iax’ Enumservice.

```
$ORIGIN 8.4.1.0.6.4.9.7.0.2.4.4.e164.arpa.
@ IN NAPTR ( 10 100 "u" "E2U+iax"
  "^.*$!iax:example.com/alice!" . )
```

This contact information indicates that the party addressed by the E.164 number +442079460148 can be contacted using the IAX protocol to domain ‘example.com’. The called party, service, or program on that domain is identified by ‘alice’.

3.2. IAX URI with a context

The following is an example of the ‘iax’ Enumservice using an IPv6 destination address and a destination ‘context’.

```
$ORIGIN 9.4.1.0.6.4.9.7.0.2.4.4.e164.arpa.
@ IN NAPTR ( 10 100 "u" "E2U+iax"
  "^.*$!iax:[2001:db8::1]:4569/alice?friends!" . )
```

This NAPTR resource record indicates that +442079460149 may be contacted by using the IAX protocol at IPv6 address 2001:db8::1, port 4569 with the called party ‘alice’ in the context (or user partition) ‘friends’. For further usage of IAX URIs see Section 2 of [RFC5456].

4. Security Considerations

The ‘iax’ Enumservice does not introduce any new security issues beyond any already present in the ENUM, DNS and IAX protocols except that this Enumservice provides for disclosure of information that may facilitate an attack or a violation of user privacy in some way. The primary result of these exploits is unwanted communications. These issues are discussed in further detail in [RFC3833].

The use of DNSSEC [RFC4033] is recommended to improve operational security.
For security considerations that apply to all Enumservices please refer to RFC 6116, Section 7.

5. IANA Considerations

This document requests registration of the ‘iax’ Enumservice according to the guidelines and specifications in [RFC6117] and the definitions in Section 2 in this document.

6. DNS Considerations

Misconfiguration or delays in zone changes can result in call loops, perhaps with different protocols or networks. Implementations should take care to ensure such loops can be detected without interrupting other services including SIP-based, IAX-based, and DNS itself.

7. Acknowledgments

This work was supported by Internet Foundation Austria. In addition, thanks to Michael Haberler, Bernie Hoeneisen and Richard Stastny for their support and guidance in writing this document.
