This document defines a YANG data model for Routing Information Base (RIB) that aligns with the I2RS RIB information model.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", " RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on May 25, 2016.
1. Introduction

The Interface to the Routing System (I2RS) [I-D.ietf-i2rs-architecture] provides read and write access to the information and state within the routing process that exists inside the routing elements, this is achieved via the protocol message exchange between I2RS clients and I2RS agents associated with the routing system. One of the functions of I2RS is to read and write data of Routing Information Base (RIB). [I-D.ietf-i2rs-usecase-reqs-summary] introduces a set of RIB use cases. The RIB information model is defined in [I-D.ietf-i2rs-rib-info-model].
This document defines a YANG [RFC6020][RFC6991] data model for the RIB that satisfies the RIB use cases and aligns with the RIB information model.

1.1. Definitions and Acronyms

RIB: Routing Information Base

Information Model (IM): An abstract model of a conceptual domain, independent of a specific implementation or data representation.

1.2. Tree Diagrams

A simplified graphical representation of the data model is used in this document. The meaning of the symbols in these diagrams is as follows:

- Brackets "[" and "]" enclose list keys.
- Abbreviations before data node names: "rw" means configuration (read-write) and "ro" state data (read-only).
- Symbols after data node names: "?" means an optional node and "*" denotes a "list" and "leaf-list".
- Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").
- Ellipsis ("...") stands for contents of subtrees that are not shown.

2. Model Structure

The following figure shows an overview of structure tree of the ietf-i2rs-rib module. To give a whole view of the structure tree, some details of the tree are omitted. The relevant details are introduced in the following sub-sections.

```
module: ietf-i2rs-rib

2.1. RIB Capability

RIB capability negotiation is very important because not all of the hardware will be able to support all kinds of nexthops and there should be a limitation on how many levels of lookup can be practically performed. Therefore, a RIB data model MUST specify a way for an external entity to learn about the functional capabilities of a network device.

At the same time, nexthop chains can be used to specify multiple headers over a packet, before that particular packet is forwarded. Not every network device will be able to support all kinds of nexthop chains along with the arbitrary number of headers which are chained together. The RIB data model MUST provide a way to expose the nexthop chaining capability supported by a given network device.
This module uses the feature and if-feature statements to achieve above capability negoriation.

2.2. Routing Instance and Rib

A routing instance, in the context of the RIB information model, is a collection of RIBs, interfaces, and routing protocol parameters. A routing instance creates a logical slice of the router and can allow multiple different logical slices; across a set of routers; to communicate with each other. And the routing protocol parameters control the information available in the RIBs. More detail about routing instance can be found in Section 2.2 of [I-D.ietf-i2rs-rib-info-model].

For a routing instance, there will be multiple RIBs. Therefore, this model uses "list" to express the RIBs. The structure tree is shown as following figure.

```
+--rw routing-instance
   +--rw name              string
   +--rw interface-list* [name]
   | +--rw name if:interface-ref
   +--rw router-id?        yang:dotted-quad
   +--rw lookup-limit?     uint8
   +--rw rib-list* [name]
   | +--rw name            string
   | +--rw rib-family      rib-family-def
   | +--rw ip-rpf-check?   boolean
   +--rw route-list* [route-index]
   ... (refer to Section 2.3)

Figure 2: Routing Instance Structure
```

2.3. Route

A route is essentially a match condition and an action following that match. The match condition specifies the kind of route (e.g., IPv4, MPLS, MAC, Interface etc.) and the set of fields to match on.

According to the definition in [I-D.ietf-i2rs-rib-info-model], a route MUST associate with the following attributes:

- **ROUTE_PREFERENCE**: See Section 2.3 of [I-D.ietf-i2rs-rib-info-model].

- **ACTIVE**: Indicates whether a route is fully resolved and is a candidate for selection.
o INSTALLED: Indicates whether the route got installed in the FIB.

In addition, a route can associate with one or more optional route attributes (e.g., route-vendor-attributes).

For a RIB, there will have a number of routes, so the routes are expressed as a list under a specific rib. Each rib has its own route list.

---rw route-list* [route-index]
  ---rw route-index                uint64
  ---rw match
    +--rw (route-type)?
       +--:(ipv4)
          +--rw ipv4
             +--rw (ip-route-match-type)?
                +--:(dest-ipv4-address)
                |    ...
                +--:(src-ipv4-address)
                |    ...
                +--:(dest-src-ipv4-address)
                |    ...
          +--:(ipv6)
             +--rw ipv6
                +--rw (ip-route-match-type)?
                    +--:(dest-ipv6-address)
                    |    ...
                    +--:(src-ipv6-address)
                    |    ...
                    +--:(dest-src-ipv6-address)
                    |    ...
         +--:(mpls-route)

         +--:(mac-route)
             +--rw mac-address             uint32
         +--:(interface-route)
             +--rw interface-identifier if:interface-ref
  ---rw nexthop
     |    ...(refer to Section 2.4)

Figure 3: Routes Structure

2.4. Nexthop

A nexthop represents an object resulting from a route lookup. As illustrated in Section 2.4 of [I-D.ietf-i2rs-rib-info-model], to support various of use cases (e.g., load balance, protection, multicast or the combination of them), the nexthop is modelled as a
multi-level structure and supports recursion. The first level of the
nexthop includes the following four types:

- **Base**: The "base" nexthop is the foundation of all other nexthop
types. It includes the follow basic nexthops:
  - nexthop-id
  - IPv4 address
  - IPv6 address
  - egress-interface
  - egress-interface with IPv4 address
  - egress-interface with IPv6 address
  - egress-interface with MAC address
  - logical-tunnel
  - tunnel-encap
  - tunnel-decap
  - rib-name

- **Chain**: Provide a way to perform multiple operations on a packet by
  logically combining them.

- **Load-balance**: Designed for load-balance case where it normally
  will have multiple weighted nexthops.

- **Protection**: Designed for protection scenario where it normally
  will have primary and standby nexthop.

- **Replicate**: Designed for multiple destinations forwarding.

The structure tree of nexthop is shown in the following figures.
Figure 5 (as shown blow) is a sub-tree of nexthop, it’s under the nexthop base node and shows that structure of the "base" nexthop.

```
+-rw nexthop
  |  +-rw nexthop-id?    uint32
  |  +--rw sharing-flag? boolean
  |  +--rw (nexthop-type)?
  |     +--:(nexthop-base)
  |     |       ...(refer to Figure 5)
  |     +--:(nexthop-chain) {nexthop-chain}?
  |        +--rw nexthop-chain

2.5.  RPC Operations

This module defines the following RPC operations:

- **rib-add**: It is defined to add a rib to a routing instance. A name of the rib, address family of the rib and whether the RPF check is enabled are passed as the input parameters. The output is the result of the add operation:
  
  * true - success;
  *
  * false - failed; when failed, the i2rs agent may return the specific reason that causes the failure.

- **rib-delete**: It is defined to delete a rib from a routing instance. When a rib is deleted, all routes installed in the rib will be deleted. A name of the rib is passed as the input parameter. The output is the result of the delete operation:
  
  * true - success;
  *
  * false - failed; when failed, the i2rs agent may return the specific reason that causes the failure.

- **route-add**: It is defined to add a route or a set of routes to a rib. A rib name, the route prefix(es), route attributes, route vendor attributes, nexthop and whether return failure detail are passed as the input parameters. Before calling the route-add rpc, it is required to call the nh-add rpc to create and/or return the nexthop identifier. The output is a combination of the route operation states that include:
  
  * success-count: the numbers of routes that are successfully added;
* failed-count: the numbers of the routes that are failed to be added;

* failure-detail: shows the specific failed routes that failure reason.

- route-delete: It is defined to delete a route or a set of routes from a rib. A name of the rib, the route prefix(es) and whether return failure detail are passed as the input parameters. The output is combination of the route operation states that include:

  * success-count: the numbers of routes that are successfully deleted;
  
  * failed-count: the numbers of the routes that are failed to be deleted;
  
  * failure-detail: shows the specific failed routes that failure reason.

- route-update: It is defined to update a route or a set of routes. A rib name, the route prefix(es), or route attributes, or route vendor attributes, or nexthop are passed as the input parameters. The match conditions can be either route prefix(es), or route attributes, or route vendor attributes, or nexthop. The update actions include: update the nexthop, update the route attributes, update the route vendor attributes. The output is combination of the route operation states that include:

  * success-count: the numbers of routes that are successfully updated;
  
  * failed-count: the numbers of the routes that are failed to be updated;
  
  * failure-detail: shows the specific failed routes that failure reason.

- nh-add: It is defined to add a nexthop to a rib. A name of the rib and a nexthop are passed as the input parameters. The network node is required to allocate a nexthop identifier to the nexthop. The outputs include the result of the nexthop add operation.

  * true – success; when success, a nexthop identifier will be returned to the i2rs client.
  
  * false – failed; when failed, the i2rs agent may return the specific reason that causes the failure.
nh-delete: It is defined to delete a nexthop from a rib. A name of a rib and a nexthop or nexthop identifier are passed as the input parameters. The output is the result of the delete operation:

* true - success;

* false - failed; when failed, the i2rs agent may return the specific reason that causes the failure.

The structure tree of rpcs is showing in following figure.

2.6. Notifications

Asynchronous notifications are sent by the RIB manager of a network device to an external entity when some event triggers on the network device. A RIB data-model MUST support sending 2 kind of asynchronous notifications.

1. Route change notification:
   - Installed (Indicates whether the route got installed in the FIB);
   - Active (Indicates whether a route is fully resolved and is a candidate for selection);
   - Reason - E.g. Not authorized

2. Nexthop resolution status notification

Nexthops can be fully resolved nexthops or an unresolved nexthop.

A resolved nexthop has adequate level of information to send the outgoing packet towards the destination by forwarding it on an interface of a directly connected neighbor.

An unresolved nexthop is something that requires the RIB manager to determine the final resolved nexthop. For example, in a case when a nexthop could be an IP address. The RIB manager would resolve how to reach that IP address, e.g. by checking if that particular IP is address reachable by regular IP forwarding or by a MPLS tunnel or by both. If the RIB manager cannot resolve the nexthop, then the nexthop remains in an unresolved state and is NOT a suitable candidate for installation in the FIB.

The structure tree of notifications is shown in the following figure.
notifications:
  +---n nexthop-resolution-status-change
  |  +---ro nexthop
  |     +---ro nexthop-id                       uint32
  |     +---ro sharing-flag                    boolean
