Dissemination of Flow Specification Rules for IPv6
draft-ietf-idr-flow-spec-v6-04

Abstract

This specification extends the current [RFC5575] and defines changes to the original document in order to make it also usable and applicable to IPv6 data packets.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on August 1, 2014.

1. Introduction

The growing amount of IPv6 traffic in private and public networks requires the extension of tools used in the IPv4 only networks to be also capable of supporting IPv6 data packets.

This specification should be treated as an extension of base [RFC5575] specification and not its replacement. It only defines the delta changes required to support IPv6 while all other definitions and operation mechanisms of Dissemination of Flow Specification Rules will remain in the main specification and will not be repeated here.

2. IPv6 Flow Specification encoding in BGP

The [RFC5575] defines a new SAFIs (133 for IPv4) and (134 for VPNv4) applications in order to carry corresponding to each such application flow specification.
This document will redefine the [RFC5575] SAFIs in order to make them AFI specific and applicable to both IPv4 and IPv6 applications.

The following changes are defined:

"SAFI 133 for IPv4 dissemination of flow specification rules" to now be defined as "SAFI 133 for dissemination of unicast flow specification rules"

"SAFI 134 for VPNv4 dissemination of flow specification rules" to now be defined as "SAFI 134 for dissemination of L3VPN flow specification rules"

For both SAFIs the indication to which address family they are referring to will be recognized by AFI value (AFI=1 for IPv4 or VPNv4, AFI=2 for IPv6 and VPNv6 respectively). Such modification is fully backwards compatible with existing implementation and production deployments.

It needs to be observed that such choice of proposed encoding is compatible with filter validation against routing reachability information as described in section 6 of RFC5575. Validation tables will now be performed according to the following rules.

Flow specification received over AFI/SAFI=1/133 will be validated against routing reachability received over AFI/SAFI=1/1

Flow specification received over AFI/SAFI=1/134 will be validated against routing reachability received over AFI/SAFI=1/128

Flow specification received over AFI/SAFI=2/133 will be validated against routing reachability received over AFI/SAFI=2/1

Flow specification received over AFI/SAFI=2/134 will be validated against routing reachability received over AFI/SAFI=2/128

3. IPv6 Flow Specification types changes

The following component types are redefined or added for the purpose of accommodating new IPv6 header encoding. Unless otherwise stated all other types as defined in RFC5575 apply to IPv6 packets as is.

Type 1 - Destination IPv6 Prefix

Encoding: <type (1 octet), prefix offset (1 octet), prefix length (1 octet), prefix>
Defines the destination prefix to match. Prefix offset has been
defined to allow for flexible matching on part of the IPv6 address
where we want to skip (don’t care) of N first bits of the address.
This can be especially useful where part of the IPv6 address
consists of an embedded IPv4 address and matching needs to happen
only on the embedded IPv4 address. The encoded prefix contains
enough octets for the bits used in matching (length minus offset
bits).

Type 2 - Source IPv6 Prefix

Encoding: <type (1 octet), prefix offset (1 octet), prefix length
(1 octet), prefix>

Defines the source prefix to match. Prefix offset has been
defined to allow for flexible matching on part of the IPv6 address
where we want to skip (don’t care) of N first bits of the address.
This can be especially useful where part of the IPv6 address
consists of an embedded IPv4 address and matching needs to happen
only on the embedded IPv4 address. The encoded prefix contains
enough octets for the bits used in matching (length minus offset
bits).

Type 3 - Next Header

Encoding: <type (1 octet), [op, value]+>

Contains a set of {operator, value} pairs that are used to match
the last Next Header value octet in IPv6 packets. The operator
byte is encoded as specified in component type 3 of [RFC5575].

While IPv6 allows for more then one Next Header field in the
packet the main goal of Type 3 flow specification component is to
match on the subsequent IP protocol value. Therefore the
definition is limited to match only on last Next Header field in
the packet.

Type 12 - Fragment

Encoding: <type (1 octet), [op, bitmask]+>

Uses bitmask operand format defined above. Bit-7 is not used and
MUST be 0 to provide backwards-compatibility with the definition
in RFC5575.
Bitmask values:

+ Bit 6 - Is a fragment (IsF)
+ Bit 5 - First fragment (FF)
+ Bit 4 - Last fragment (LF)

Type 13 - Flow Label - New type

Encoding: <type (1 octet), [op, value]+>

Contains a set of {operator, value} pairs that are used to match the 20-bit Flow Label field [RFC2460]. The operator byte is encoded as specified in the component type 3 of [RFC5575].

Type 14 - Traffic Class - New type

Encoding: <type (1 octet), [op, value]+>

Contains a set of {operator, value} pairs that are used to match the full Traffic Class 8-bit field [RFC2460] encoded in a single octet. The operator byte is encoded as specified in component type 3 of [RFC5575].

The following example demonstrates the new prefix encoding for: "all packets to ::1234:5678:9A00:0/80-104 from 192::/8 and port {range [137, 139] or 8080}".

<table>
<thead>
<tr>
<th>destination</th>
<th>source</th>
<th>port</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x01 40 68 12 34 56 78 9A</td>
<td>02 00 08 c0</td>
<td>04 03 89 45 8b 91 1f 90</td>
</tr>
</tbody>
</table>

3.1. Order of Traffic Filtering Rules

The original definition for the order of traffic filtering rules can be reused with new consideration for the IPv6 prefix offset. As long as the offsets are equal, the comparison is the same, retaining longest-prefix-match semantics. If the offsets are not equal, the
lowest offset has precedence, as this flow matches the most significant bit.

Pseudocode:

```c
flow_rule_v6_cmp (a, b)
{
    comp1 = next_component(a);
    comp2 = next_component(b);
    while (comp1 || comp2) {
        // component_type returns infinity on end-of-list
        if (component_type(comp1) < component_type(comp2)) {
            return A_HAS_PRECEDENCE;
        }
        if (component_type(comp1) > component_type(comp2)) {
            return B_HAS_PRECEDENCE;
        }

        if (component_type(comp1) == IPV6_DESTINATION || IPV6_SOURCE) {
            // offset not equal, lowest offset has precedence
            // offset equal ...
            common_len = MIN(prefix_length(comp1), prefix_length(comp2));
            cmp = prefix_compare(comp1, comp2, offset, common_len);
            // not equal, lowest value has precedence
            // equal, longest match has precedence
        } else {
            common = MIN(component_length(comp1), component_length(comp2));
            cmp = memcmp(data(comp1), data(comp2), common);
            // not equal, lowest value has precedence
            // equal, longest string has precedence
        }
    }
    return EQUAL;
}
```

4. IPv6 Flow Specification Traffic Filtering Action changes

One of the traffic filtering actions which can be expressed by BGP extended community is defined in [RFC5575] as traffic-marking. This extended community type is of value: 0x8009.

For the purpose of making it compatible with IPv6 header action expressed by presence of this extended community has been modified to read:
Traffic Marking: The traffic marking extended community instructs a system to modify first 6 bits of Traffic Class field as (recommended by [RFC2474]) of a transiting IPv6 packet to the corresponding value. This extended community is encoded as a sequence of 42 zero bits followed by the 6 bits overwriting DSCP portion of Traffic Class value.

Another traffic filtering action defined in [RFC5575] as a BGP extended community is redirect. To allow an IPv6 address specific route-target, a new traffic action IPv6 address specific extended community is provided. The extended community type has the value 0x800b.

Redirect-IPv6: The redirect IPv6 address specific extended community allows the traffic to be redirected to a VRF routing instance that lists the specified IPv6 address specific route-target in its import policy. If several local instances match this criteria, the choice between them is a local matter (for example, the instance with the lowest Route Distinguisher value can be elected). This extended community uses the same encoding as the IPv6 address specific Route Target extended community [RFC5701].

5. Security considerations

No new security issues are introduced to the BGP protocol by this specification.

6. IANA Considerations

IANA is requested to rename currently defined SAFI 133 and SAFI 134 per [RFC5575] to read:

133     Dissemination of flow specification rules
134     L3VPN dissemination of flow specification rules

IANA is requested to create and maintain a new registry entitled: "Flow Spec IPv6 Component Types". The following component types have been registered:

Type 1 - Destination IPv6 Prefix
Type 2 - Source IPv6 Prefix
Type 3 - Next Header
Type 4 - Port
Type 5 - Destination port
Type 6 - Source port
Type 7 - ICMP type
Type 8 - ICMP code
Type 9 - TCP flags
Type 10 - Packet length
Type 11 - DSCP
Type 12 - Fragment
Type 13 - Flow Label
Type 14 - Traffic Class

7. Acknowledgments

Authors would like to thank Pedro Marques, Hannes Gredler and Bruno Rijsman, Brian Carpenter, and Thomas Mangin for their valuable input.
