Definitions of Managed Objects for FCIP

1. Status of this Memo:

This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of RFC2026.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/1id-abstracts.txt

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html.

2. Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in TCP/IP based internets. In particular it defines objects for managing FCIP entities, as defined in [FCIP] and used in FC fabrics as described in [FCBB2].
3. The SNMP Management Framework

The SNMP Management Framework presently consists of five major components:

- An overall architecture, described in RFC 2571 [RFC2571].

- Mechanisms for describing and naming objects and events for the purpose of management. The first version of this Structure of Management Information (SMI) is called SMIv1 and described in STD 16, RFC 1155 [RFC1155], STD 16, RFC 1212 [RFC1212] and RFC 1215 [RFC1215]. The second version, called SMIv2, is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

- Message protocols for transferring management information. The first version of the SNMP message protocol is called SNMPv1 and described in STD 15, RFC 1157 [RFC1157]. A second version of the SNMP message protocol, which is not an Internet standards track protocol, is called SNMPv2c and described in RFC 1901 [RFC1901] and RFC 1906 [RFC1906]. The third version of the message protocol is called SNMPv3 and described in RFC 1906 [RFC1906], RFC 2572 [RFC2572] and RFC 2574 [RFC2574].

- Protocol operations for accessing management information. The first set of protocol operations and associated PDU formats is described in STD 15, RFC 1157 [RFC1157]. A second set of protocol operations and associated PDU formats is described in RFC 1905 [RFC1905].

- A set of fundamental applications described in RFC 2573 [RFC2573] and the view-based access control mechanism described in RFC 2575 [RFC2575].

A more detailed introduction to the current SNMP Management Framework can be found in RFC 2570 [RFC2570].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the mechanisms defined in the SMI.

This memo specifies a MIB module that is compliant to the SMIv2. A MIB conforming to the SMIv1 can be produced through the appropriate translations. The resulting translated MIB must be semantically equivalent, except where objects or events are omitted because no translation is possible (use of Counter64). Some machine readable information in SMIv2 will be converted into textual descriptions in SMIv1 during the translation process. However, this loss of machine
4. Overview of FCIP management model

Note that the FCIP Entity is fully described in [FCIP] from a functional point of view. A collection of multiple instances of FCIP Entities and the corresponding FC Entities, described in [BB2], within a single management entity is referred to as a FCIP device here. This section describes FCIP from a management point of view.

The FCIP device provides IP-based interconnection model to interconnect FC fabric elements. In this model, the FCIP devices along with the IP network on which they are running provide a new FCIP transport network.

This IP-based FCIP Interconnection Model supports the following topology:
- The FCIP-based transport network is formed by interconnecting the FCIP-devices.
- Each FCIP device has one or more FCIP Entities or Instances.
- Peer FCIP Entities are connected by FCIP Links, attached to VE_ports/B_Access.
- Each FCIP Link contains one or more Data Engines.
- The FCIP device can work as a standalone box or as part of a FC fabric element.

Each FCIP Entity managed by this MIB is referred to as a FCIP Instance. The MIB is broken up as follows:

4.1 FCIP Entity Instances Table
The FCIP Entity table contains information about this entity’s existing instances of FCIP entities.

4.2 FCIP Link Table
The FCIP link table contains information about this FCIP device’s existing FCIP links.

4.3 FCIP TCP Connection Table
The FCIP TCP Connection table contains information about existing TCP connections. Each FCIP link within a FCIP entity contains one or more TCP connections. The FCIP entity employs a Data Engine for each TCP connection for handling FC frame encapsulation, de-encapsulation and transmission of FCIP frames on the connection.

4.4 FCIP Dynamic Route Table
The FCIP dynamic route table contains routing information that is dynamically discovered by this FCIP device. The FCIP device may use...
the SLPv2 protocol in conjunction with other protocols, such as FSPF, to dynamically discover other FCIP entities, and populate this table to map destination domains to FCIP Links.

4.5 FCIP Static Route Table
The FCIP static route table contains routing information that is statically configured into this FCIP device by Network Admin. In the absence of dynamic discovery of remote FCIP entities, the Network Manager will configure remote domains and FCIP Entities that are reachable by this device into this table.

4.6 FCIP Discovery Domain Table
The FCIP Discovery Domain Table maps this device’s FCIP Entities into FCIP Discovery Domains.

4.7 FCIP Link Error Table
The FCIP Link Errors Table contains counters that indicate error conditions on an FCIP Link.

5. Relationship to other MIBs

Objects accessible from other MIBs applicable to FCIP devices have not been included in this MIB.

5.1 Relationship to the ’TCP’ group of MIB-II
This group is mandatory for all systems which implement TCP. Objects relevant to TCP must be obtained from this group.

5.2 Relationship to the ’interfaces’ MIB
The ’interfaces’ group is defined as being mandatory for all systems and contains information on an entity’s interfaces. Each logical/virtual interface created as an FCIP Link should be represented as a row in the ifTable with a unique ifIndex value and a value of ifType common to all such FCIP Links. These are the only ifIndex values of relevance to an FCIP Entity because FCIP runs over top of TCP/IP. When an FCIP entity has data to transmit to a peer FCIP entity, it gives it to TCP, and TCP formats the data into segments and gives them to IP; IP puts the data into datagrams which it sends on whatever one or more physical interfaces IP has available. Therefore, only IP, not an FCIP Entity, has knowledge of the ifIndex values for physical interfaces. Note that ifStackTable may be used to find the physical interface over which an FCIP Link is running.

5.3 Relationship to the Fibre Channel Management MIB
The Fibre Channel Management MIB [FCMGMT] is assumed for FC functionality managed objects.

6. Changes from draft-ietf-ips-fcip-mib-01.txt

- Comments from NM advisor Keith McCloghrie
- Added this change log
- Updated introductory text
- Added instance terminology to FCIP Entity for consistency with IPS MIBs.
- Changed fcFcip prefix to fcip.

- Removed fcFcipMode as a scalar applicable to all instances; moved into the FCIP Link table.
- RowStatus object added to the tables that support row creation (fcipEntityTable, fcipLinkTable, fcipStaticRouteTable)
- WWN of a FC Entity, FcNameIdOrZero, imported from FC-MGMT-MIB.
- IpAddress format replaced by InetAddressType and InetAddress pair from INET-ADDRESS-MIB.
- fcipEntityTcpConnPort - description modified to say "it contains the value zero(0) if the FCIP Entity only listens on the well-known port."
- fcipEntityPHBIpOption object renamed as fcipEntityPHBSupport.
- TruthValue type added and used wherever necessary.
- fcipTcpConnRemPort added as part of Index list in the fcipTcpConnTable table.
- The advertised TCP RW Size changed to default maximum TCP RW size.
- FSPF usage added for finding domain IDs in the fcipDynamicRouteTable.
- INDEX modified in fcipDynamicRouteTable and fcipStaticRouteTable.
- fcipLinkIfIndex removed from INDEX in fcipLinkTable.
- Added name object to FCIP Entity table (Display String of
Size 32 with read-write access).

- Added fcipDiscoveryDomainTable.

- fcEntityMode textual convention added to define the type of port mode provided by an FCIP entity for FCIP Links.

- fcipLinkLocalFcipEntityMode added to the fcipLinkTable to indicate the type of port mode (E_Ports or B_Ports) provided by the local FCIP entity.

- fcipLinkErrorsTable added to define counters for error cases that cause closing down TCP connections.

- Specified in "Relationship to interfaces MIB" that each FCIP Link runs over a virtual interface represented by an entry in the interfaces table. Updated fcipLinkIfIndex accordingly.

- REVISION and DESCRIPTION clause added to MODULE-IDENTITY.

- Object fcipFabricWWN renamed as fcipDeviceWWN.

- fcipEntityInstanceTable - read-write attributes changed to read-create.

- Moved fcipEntitySACKOption to device level from FCIP entity level, and changed MAX-ACCESS to read-only.

- IP Address objects fcipLinkLocalFcipEntityAddressType and fcipLinkLocalFcipEntityAddress added to the fcipLinkTable.

- fcipLinkTable - read-write attributes changed to read-create.

- fcipTcpConnTimeOut removed from fcipTcpConnTable.

- Added fcipDynamicRouteIndex to the INDEX clause of the fcipDynamicRouteTable.

- Added fcipStaticRouteIndex to the INDEX clause of the fcipStaticRouteTable.

- Removed objects fcipStaticRouteRemFcipEntityWWN, fcipStaticRouteRemFcipEntityId, fcipStaticRouteRemFcipEntityAddressType and fcipStaticRouteRemFcipEntityAddress from fcipStaticRouteTable and added fcipStaticRouteLinkIndex to the same.

- All read-write attributes changed to read-create in the fcipStaticRouteTable.
- Added REFERENCE clauses for fcipEntitySACKOption, fcipEntitySeqNumWrap, fcipEntityPHBSupport

- Made tables fcipDynamicRouteEntry and fcipStaticRoute conditionally mandatory rather than mandatory. They will be optional for implementations which contain the same information in another FC MIB (although such implementations may choose to report these tables for convenience).

- Added conformance groups and compliance statement.

- Added security considerations section.

- Updated references section.

   }
   STATUS current
   DESCRIPTION
      "A collection of objects providing information about FCIP
      static routes."
   ::= { fcipGroups 8 }
8. Security considerations

There are a number of management objects defined in this MIB that have a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

There are a number of managed objects in this MIB that contain what could be considered as sensitive information. In particular, the objects which provide information on identification and network topology:

- fcipDeviceWWN
- fcipEntityName
- fcipEntityAddress
- fcipLinkLocalFcipEntityAddress
- fcipLinkRemFcipEntityWWN
- fcipLinkRemFcipEntityAddress
- fcipDynamicRouteTable
- fcipStaticRouteTable
- fcipDiscoveryDomainTable

Therefore, it may be important in some environments to control read access to these objects and possibly to even encrypt their values when sending them over the network via SNMP. Not all versions of SNMP provide features for such a secure environment.

SNMPv1 by itself is not a secure environment. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB.

It is recommended that the implementers consider the security features as provided by the SNMPv3 framework. Specifically, the use of the User-based Security Model RFC 2574 [RFC2574] and the View-based Access Control Model RFC 2575 [RFC2575] is recommended. It is then a customer/user responsibility to ensure that the SNMP entity giving access to an instance of this MIB, is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

9. Intellectual Property

The IETF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain
to the implementation or use of the technology described in this
document or the extent to which any license under such rights might or
might not be available; neither does it represent that it has made any
effort to identify any such rights. Information on the IETF’s
procedures with respect to rights in standards-track and standards-
related documentation can be found in BCP-11. Copies of claims of
rights made available for publication and any assurances of licenses to
be made available, or the result of an attempt made to obtain a general
license or permission for the use of such proprietary rights by
implementors or users of this specification can be obtained from the
IETF Secretariat.

The IETF invites any interested party to bring to its attention any
copyrights, patents or patent applications, or other proprietary rights
which may cover technology that may be required to practice this
standard. Please address the information to the IETF Executive
Director.

10. Acknowledgements

The authors acknowledge significant feedback and guidance from NM Area
advisor Keith McCloghrie, Cisco. In addition, comments and feedback from
members of the FCIP Working Group have been incorporated.
