Abstract

This document defines a YANG data model that can be used to configure and manage IS-IS protocol on network elements. It also defined an extension module for segment routing configuration and operation.

Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on March 24, 2017.

1. Introduction

This document defines a YANG data model for IS-IS routing protocol. The data model covers configuration of an IS-IS routing protocol instance as well as operational states.

1.1. Tree diagram

A simplified graphical representation of the data model is presented in Section 2.

The meaning of the symbols in these diagrams is as follows:

- Brackets "[" and "]" enclose list keys.
- Curly braces "{" and "}" contain names of optional features that make the corresponding node conditional.
- Abbreviations before data node names: "rw" means configuration (read-write), and "ro" state data (read-only).
- Symbols after data node names: "?" means an optional node and "*" denotes a "list" or "leaf-list".
- Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").
- Ellipsis ("...") stands for contents of subtrees that are not shown.

2. Design of the Data Model

The IS-IS YANG module is divided in two main "isis" containers that are augmenting the "routing-protocol" lists in ietf-routing module with specific IS-IS parameters.

One container contains the writable parameters, while the other contains the operational states.

The figure below describe the overall structure of the isis YANG module:

```
module: ietf-isis
augment /rt:routing-state/rt:ribs/rt:rib/rt:routes/rt:route:
  +++-ro metric?       uint32

2.1. IS-IS Configuration

The IS-IS configuration container is divided in:

- Global parameters.
o Per interface configuration (see Section 2.4).

It would to up to extension modules to augment this model to support vendor specific parameters.

2.2. Multitopology Parameters

The "topologies" list is used to enable support of MT extensions for specific address families.

Each topology should refer to an existing RIB.

Some specific parameters could be defined for a specific topology at global level and also at interface level.

2.3. Per-Level Parameters

Some parameters support per level configuration. In this case, the parameter is built as a container with three levels of configuration:

o top level : corresponds to level-1-2, so the configuration applies to both levels.

o level-1 : corresponds to level-1 specific parameter.

o level-2 : corresponds to level-2 specific parameter.

```
+--rw priority
  |  +--rw value?   uint8
  |  +--rw level-1
  |     |  +--rw value?   uint8
  |  +--rw level-2
  |     +--rw value?   uint8
```

Example :

```
<priority>
  <value>250</value>
  <level-1>
    <value>100</value>
  </level-1>
  <level-2>
    <value>200</value>
  </level-2>
</priority>
```
An implementation SHOULD prefer a level specific parameter over level-all parameter. As example, if priority is 100 for level-1, 200 for level-2 and 250 for top level configuration, the implementation should use 100 for level-1 and 200 for level-2.

Some parameters like overload bit and route preference are not modelled for per level configuration. If an implementation supports per level configuration for such parameter, the implementation SHOULD augment the current model by adding level-1 and level-2 containers and reusing existing configuration groupings.

Example of augmentation:

```plaintext
augment "/rt:routing/" +
  "rt:routing-protocols/rt:routing-protocol" +
  "/isis:isis/isis:overload" {
    when "rt:type = 'isis:isis'" {
      description
      "This augment IS-IS routing protocol when used";
    }
    description
    "This augments IS-IS overload configuration with per level configuration.";

    container level-1 {
      uses isis:overload-global-cfg;
      description
      "Level 1 configuration.";
    }
    container level-2 {
      uses isis:overload-global-cfg;
      description
      "Level 2 configuration.";
    }
  }

Moreover, if an implementation does not support per level configuration for a parameter, like priority, which has per level configuration, the implementation SHOULD advertise a deviation to announce the non support of the level-1 and level-2 containers.

Finally, if an implementation supports per level configuration but does not support the level-1-2 configuration, it SHOULD also advertise a deviation.
2.4. Per-Interface Parameters

The per-interface section of the IS-IS instance describes the interface specific parameters.

The interface is a reference to an interface in the Interface YANG model.

Each interface has interface-specific parameters that may have a different value per level as described in previous section. An interface-specific parameter always override an IS-IS global parameter.

Some parameters like hello-padding are defined as containers to permit easy extension by vendor specific modules.

TODO : interfaces.tree

2.5. ISO parameters

Some ISO parameters may be required.

This module augments interface configuration model to support ISO configuration parameters.

The clns-mtu can be defined under the interface.

2.6. IP FRR

This YANG model supports LFA and remote LFA as IP FRR techniques. The "fast-reroute" container may be augmented by other models to support other IPFRR flavors (MRT ...).

The current version of the model supports activation of LFA and remote LFA at interface only. The global "lfa" container is present but kept empty to permit augmentation with vendor specific properties like policies.

Remote LFA is considered as a child of LFA. Remote LFA cannot be enabled if LFA is not enabled.

The "candidate-disabled" permit to mark an interface to not be used as a backup.
2.7. Operational State

"isis" container provides operational states for IS-IS. This container is divided in multiple components:

- system-counters : provides statistical informations about the global system.
- interface : provides configuration state information for each interface.
- adjacencies: provides state information about current IS-IS adjacencies.
- spf-log: provides information about SPF events on the node.
- lsp-log: provides information about LSP events on the node (reception of an LSP or modification of local LSP).
- database: provides details on current LSDB.
- hostnames: provides information about system-id to hostname mappings.
- fast-reroute: provides information about IP FRR.

3. RPC Operations

The "ietf-isis" module defines two RPC operations:

- clear-isis-database: reset the content of a particular IS-IS database and restart database synchronization with the neighbors.
- clear-isis-adjacency: restart a particular set of IS-IS adjacencies.

rpcs:

```plaintext
+----x clear-adjacency
 | +--ro input
 |    +--ro routing-protocol-instance-name    instance-state-ref
 |    +--ro level?                            level
 |    +--ro interface?                        string
+----x clear-database
 +--ro input
    +--ro routing-protocol-instance-name    instance-state-ref
    +--ro level?                            level
```
4. Notifications

The "ietf-isis" module introduces some notifications:

- **database-overload**: raised when overload condition is changed.
- **lsp-too-large**: raised when the system tries to propagate a too large PDU.
- **corrupted-lsp-detected**: raised when the system find that an LSP that was stored in memory has become corrupted.
- **attempt-to-exceed-max-sequence**: This notification is sent when the system wraps the 32-bit sequence counter of an LSP.
- **id-len-mismatch**: This notification is sent when we receive a PDU with a different value for the System ID length.
- **max-area-addresses-mismatch**: This notification is sent when we receive a PDU with a different value for the Maximum Area Addresses.
- **own-lsp-purge**: This notification is sent when the system receives a PDU with its own system ID and zero age.
- **sequence-number-skipped**: This notification is sent when the system receives a PDU with its own system ID and different contents. The system has to reissue the LSP with a higher sequence number.
- **authentication-type-failure**: This notification is sent when the system receives a PDU with the wrong authentication type field.
- **authentication-failure**: This notification is sent when the system receives a PDU with the wrong authentication information.
- **version-skew**: This notification is sent when the system receives a PDU with a different protocol version number.
- **area-mismatch**: This notification is sent when the system receives a Hello PDU from an IS that does not share any area address.
- **rejected-adjacency**: This notification is sent when the system receives a Hello PDU from an IS but does not establish an adjacency for some reason.
protocols-supported-mismatch : This notification is sent when the system receives a non pseudonode LSP that has no matching protocol supported.

lsp-error-detected : This notification is sent when the system receives a LSP with a parse error.

adjacency-change : This notification is sent when an IS-IS adjacency moves to Up state or to Down state.

lsp-received : This notification is sent when a LSP is received.

lsp-generation : This notification is sent when a LSP is regenerated.

5. Segment Routing

The IS-IS SR YANG module is augmenting IS-IS module for both configuration and operational states.

The IS-IS SR YANG module requires the base segment routing module ([I-D.ietf-spring-sr-yang]) to be supported as there is a strong relationship between those modules.

The figure below describes the overall structure of the isis-sr YANG module:

```yang
module: ietf-isis-sr
augment /rt:routing/rt:control-plane-protocols/
    rt:control-plane-protocol/isis:isis:
        ++rw segment-routing
            | ++rw enabled?    boolean
            | ++rw bindings
            |    | ++rw advertise
            |    |    | ++rw policies* string
            |    | ++rw receive?    boolean
            | ++rw protocol-srgb {sr:protocol-srgb}?
            |    ++rw srgb* [lower-bound upper-bound]
            |    | ++rw lower-bound uint32
            |    | ++rw upper-bound uint32
augment /rt:routing/rt:control-plane-protocols/
    rt:control-plane-protocol/isis:isis/
        isis:interfaces/isis:interface:
            ++rw segment-routing
                | ++rw adjacency-sid
                |    ++rw advertise-adj-group-sid* [group-id]
                |    | ++rw group-id uint32
                |    | ++rw advertise-protection? enumeration
augment /rt:routing/rt:control-plane-protocols/
    rt:control-plane-protocol/isis:isis/
        isis:interfaces/isis:interface/isis:fast-reroute:
            ++rw ti-lfa {ti-lfa}?
            | ++rw enable?    boolean
augment /rt:routing/rt:control-plane-protocols/
    rt:control-plane-protocol/isis:isis/
        isis:interfaces/isis:interface/isis:fast-reroute/isis:lfa/isis:remote-lfa:
        ++rw use-segment-routing-path?    boolean [remote-lfa-sr]?
augment /rt:routing-state/rt:control-plane-protocols/
    rt:control-plane-protocol/isis:isis:
        ++ro segment-routing
            | ++ro enabled?    boolean
            | ++ro bindings
            |    | ++ro advertise
            |    |    | ++ro policies* string
            |    | ++ro receive?    boolean
            | ++ro protocol-srgb {sr:protocol-srgb}?
```
++--ro srgb* [lower-bound upper-bound]
++--ro lower-bound uint32
++--ro upper-bound uint32

augment /rt:routing-state/rt:control-plane-protocols/
   rt:control-plane-protocol/isis:isis/
   isis:database/isis:level-db/isis:lsp:
5.1. Segment Routing activation

Activation of segment-routing IS-IS is done by setting the "enabled" leaf to true. This triggers advertisement of segment-routing extensions based on the configuration parameters that have been setup using the base segment routing module.

5.2. Advertising mapping server policy

The base segment routing module defines mapping server policies. By default, IS-IS will not advertise nor receive any mapping server entry. The IS-IS segment-routing module permits to advertise one or multiple mapping server policies through the "bindings/advertise/policies" leaf-list. The "bindings/receive" leaf permits to enable the reception of mapping server entries.

5.3. IP Fast reroute

IS-IS SR model augments the fast-reroute container under interface. It brings the ability to activate TI-LFA (topology independent LFA)
and also enhances remote LFA to use segment-routing tunneling instead of LDP.

6. Interaction with Other YANG Modules

The "isis" module augments "/if:interfaces/if:interface" with ISO specific parameters.

The "isis" operational state container augments the "/rt:routing-state/rt:control-plane-protocols/control-plane-protocol" container of the ietf-routing module by defining IS-IS specific operational states.

Some IS-IS specific routes attributes are added to route objects of the ietf-routing module by augmenting "/rt:routing-state/rt:ribs/rt:rib/rt:routes/rt:route".

The modules defined in this document use some groupings from ietf-keychain [I-D.ietf-rtgwg-yang-key-chain] and ietf-segment routing [I-D.ietf-spring-sr-yang].

7. IS-IS YANG Module

<CODE BEGINS> file "ietf-isis@2016-09-20.yang"

module ietf-isis {
  namespace "urn:ietf:params:xml:ns:yang:ietf-isis";

  prefix isis;

  import ietf-routing {
    prefix "rt";

9. Security Considerations

Configuration and state data defined in this document are designed to be accessed via the NETCONF protocol [RFC6241].

As IS-IS is an IGP protocol (critical piece of the network), ensuring stability and security of the protocol is mandatory for the network service.

Authors recommends to implement NETCONF access control model ([RFC6536]) to restrict access to all or part of the configuration to specific users. Access control to RPCs is also critical as RPC permits to clear protocol datastructures that would definitively impact the network service. This kind of RPC needs only to be used in specific cases by well-known experienced users.

Authors consider that all the configuration is considered as sensitive/vulnerable as well as RPCs. But security teams can decide to open some part of the configuration to less experienced users depending on the internal organization, for example:
o User FullWrite: would access to the whole data model. This kind of profile may be restricted to few experienced people.

o User PartialWrite: would only access to configuration part within /isis/interfaces/interface. So this kind of profile is restricted to creation/modification/deletion of interfaces. This profile does not have access to RPC.

o User Read: would only access to state part /isis-state.

Unauthorized access to configuration or RPC may cause high damages to the network service.

The /isis-state/database may contain authentication information. As presented in the description of the /isis-state/database/level-1/lsp/authentication/authentication-key, the authentication MUST never be presented in plaintext format for security reason. Authors recommends the usage of MD5 to present the authentication-key.

Some authentication-key may also be present in the /isis configuration. When configuring IS-IS using the NETCONF protocol, authors recommends the usage of secure transport of NETCONF using SSH ([RFC6242]).

10. Contributors

Authors would like to thank Kiran Agrahara Sreenivasa, Dean Bogdanovic, Yingzhen Qu, Yi Yang for their major contributions to the draft.

11. Acknowledgements

TBD.

12. IANA Considerations

The IANA is requested to assign two new URIs from the IETF XML registry ([RFC3688]). Authors are suggesting the following URIs:

Registrant Contact: IS-IS WG
XML: N/A, the requested URI is an XML namespace

Registrant Contact: IS-IS WG
XML: N/A, the requested URI is an XML namespace
This document also requests two new YANG modules name in the YANG Module Names registry ([RFC6020]) with the following suggestion:

```
name: ietf-isis
prefix: isis
reference: RFC XXXX
```

```
name: ietf-isis-sr
prefix: isis-sr
reference: RFC XXXX
```
