Abstract

This document defines a YANG data model that can be used to configure and manage IS-IS protocol on network elements.

Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] when, and only when, they appear in all capitals, as shown here.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on July 22, 2019.

1. Introduction

This document defines a YANG ([RFC7950]) data model for IS-IS routing protocol.

The data model covers configuration of an IS-IS routing protocol instance as well as operational states.

A simplified tree representation of the data model is presented in Section 2. Tree diagrams used in this document follow the notation defined in [RFC8340].

The module is designed as per NMDA (Network Management Datastore Architecture) [RFC8342].

2. Design of the Data Model

The IS-IS YANG module augments the "control-plane-protocol" list in ietf-routing module (defined in [RFC8349]) with specific IS-IS parameters.

The figure below describes the overall structure of the isis YANG module:

module: ietf-isis
    augment /rt:routing/rt:ribs/rt:rib/rt:routes/rt:route:
        +--ro metric?       uint32
        +--ro tag*          uint64
augment /rt:routing/rt:control-plane-protocols/rt:control-plane-protocol:

2.1. IS-IS Configuration

The IS-IS configuration container is divided in:

- Global parameters.
- Per interface configuration (see Section 2.4).

Additional modules may be created to support any additional parameters. These additional modules MUST augment the ietf-isis module.

The model implements features, thus some of the configuration statement becomes optional. As an example, the ability to control the administrative state of a particular IS-IS instance is optional. By advertising the feature "admin-control", a device communicates to the client that it supports the ability to shutdown a particular IS-IS instance.

The global configuration contains usual IS-IS parameters such as lsp-mtu, lsp-lifetime, lsp-refresh, default-metric...

2.2. Multitopology Parameters

The model supports multitopology (MT) IS-IS as defined in [RFC5120].

The "topologies" container is used to enable support of MT extensions.

The "name" used in the topology list should refer to an existing RIB of the device.

Some specific parameters could be defined on a per topology basis both at global level and at interface level: for example, an interface metric can be defined per topology.
Multiple address families (like IPv4 or IPv6) can also be activated within the default topology. This can be achieved using the "afs" container (requiring "nlpid-control" feature to be advertised).

2.3. Per-Level Parameters

Some parameters allow a per level configuration. In this case, the parameter is modeled as a container with three configuration locations:

- a top level container: corresponds to level-1-2, so the configuration applies to both levels.
- a level-1 container: corresponds to level-1 specific parameters.
- a level-2 container: corresponds to level-2 specific parameters.

```
+--rw priority
    |  +--rw value?   uint8
    |  +--rw level-1
    |     |  +--rw value?   uint8
    |     +--rw level-2
            |  +--rw value?   uint8
```

Example:

```
<priority>
    <value>250</value>
    <level-1>
        <value>100</value>
    </level-1>
    <level-2>
        <value>200</value>
    </level-2>
</priority>
```

An implementation SHOULD prefer a level specific parameter over a level-all parameter. As example, if the priority is 100 for the level-1, 200 for the level-2 and 250 for the top level configuration, the implementation should use 100 for the level-1 and 200 for the level-2.

Some parameters like "overload bit" and "route preference" are not modeled to support a per level configuration. If an implementation supports per level configuration for such parameter, this implementation SHOULD augment the current model by adding both level-1 and level-2 containers and SHOULD reuse existing configuration groupings.
Example of augmentation:

```yang
augment "/rt:routing/" +
    "rt:control-plane-protocols/rt:control-plane-protocol"+
    "/isis:isis/isis:overload" {
    when "rt:type = 'isis:isis'" {
        description
            "This augment IS-IS routing protocol when used";
    }
    description
        "This augments IS-IS overload configuration
        with per level configuration.";

    container level-1 {
        uses isis:overload-global-cfg;
        description
            "Level 1 configuration.";
    }
    container level-2 {
        uses isis:overload-global-cfg;
        description
            "Level 2 configuration.";
    }
}
```

If an implementation does not support per level configuration for a parameter modeled with per level configuration, the implementation SHOULD advertise a deviation to announce the non support of the level-1 and level-2 containers.

Finally, if an implementation supports per level configuration but does not support the level-1-2 configuration, it SHOULD also advertise a deviation.

### 2.4. Per-Interface Parameters

The per-interface section of the IS-IS instance describes the interface specific parameters.

The interface is modeled as a reference to an existing interface defined in the "ietf/interfaces" YANG model ([RFC8343]).

Each interface has some interface-specific parameters that may have a different per level value as described in previous section. An interface-specific parameter always override an IS-IS global parameter.
Some parameters like hello-padding are defined as containers to allow easy extension by vendor specific modules.

2.5. Authentication Parameters

The module enables authentication configuration through the IETF key-chain module ([RFC8177]). The IS-IS module imports the "ietf-key-chain" module and reuses some groupings to allow global and per interface configuration of authentication. If a global authentication is configured, an implementation SHOULD authenticate PSNPs (Partial Sequence Number Packets), CSNPs (Complete Sequence Number Packets) and LSPs (Link State Packets) with the authentication parameters supplied. The authentication of HELLO PDUs (Protocol Data Units) can be activated on a per interface basis.

2.6. IGP/LDP synchronization

[RFC5443] defines a mechanism where IGP (Interior Gateway Protocol) needs to be synchronized with LDP (Label Distribution Protocol). An "ldp-igp-sync" feature has been defined in the model to support this mechanism. The "mpls/ldp/igp-sync" leaf under "interface" allows activation of the mechanism on a per interface basis. The "mpls/ldp/igp-sync" container in the global configuration is empty on purpose and is not required for the activation. The goal of this empty container is to allow easy augmentation with additional parameters like timers for example.

2.7. ISO parameters

As IS-IS protocol is based on ISO protocol suite, some ISO parameters may be required.

This module augments interface configuration model to support ISO configuration parameters.

The clns-mtu can be defined under the interface.
2.8. IP FRR

This YANG model supports LFA (Loop Free Alternates) ([RFC5286]) and remote LFA ([RFC7490]) as IP FRR techniques. The "fast-reroute" container may be augmented by other models to support other IPFRR flavors (MRT, TILFA ...).

The current version of the model supports activation of LFA and remote LFA at interface only. The global "lfa" container is present but kept empty to allow augmentation with vendor specific properties like policies.

Remote LFA is considered as a child of LFA. Remote LFA cannot be enabled if LFA is not enabled.

The "candidate-disabled" allows to mark an interface to not be used as a backup.

2.9. Operational States

Operational states are provided in the module in various places:

- system-counters: provides statistical informations about the global system.

- interface: provides configuration state informations for each interface.

- adjacencies: provides state informations about current IS-IS adjacencies.

- spf-log: provides informations about SPF events on the node. This SHOULD be implemented as a wrapping buffer.

- lsp-log: provides informations about LSP events on the node (reception of an LSP or modification of local LSP). This SHOULD be implemented as a wrapping buffer and an implementation MAY decide to log refresh LSPs or not.

- local-rib: provides the IS-IS internal routing table view.

- database: provides details on the current LSDB.

- hostnames: provides informations about system-id to hostname mappings (as defined in [RFC5301]).

- fast-reroute: provides informations about IP FRR.
3. RPC Operations

The "ietf-isis" module defines two RPC operations:

- clear-database: reset the content of a particular IS-IS database and restart database synchronization with the neighbors.
- clear-adjacency: restart a particular set of IS-IS adjacencies.

4. Notifications

The "ietf-isis" module introduces some notifications:

- database-overload: raised when overload condition is changed.
- lsp-too-large: raised when the system tries to propagate a too large PDU.
- if-state-change: raise when the state of an interface changes.
- corrupted-lsp-detected: raised when the system find that an LSP that was stored in memory has become corrupted.
- attempt-to-exceed-max-sequence: This notification is sent when the system wraps the 32-bit sequence counter of an LSP.
- id-len-mismatch: This notification is sent when we receive a PDU with a different value for the System ID length.
- max-area-addresses-mismatch: This notification is sent when we receive a PDU with a different value for the Maximum Area Addresses.
- own-lsp-purge: This notification is sent when the system receives a PDU with its own system ID and zero age.
- sequence-number-skipped: This notification is sent when the system receives a PDU with its own system ID and different contents. The system has to reissue the LSP with a higher sequence number.
- authentication-type-failure: This notification is sent when the system receives a PDU with the wrong authentication type field.
- authentication-failure: This notification is sent when the system receives a PDU with the wrong authentication information.
version-skew: This notification is sent when the system receives a PDU with a different protocol version number.

area-mismatch: This notification is sent when the system receives a Hello PDU from an IS that does not share any area address.

rejected-adjacency: This notification is sent when the system receives a Hello PDU from an IS but does not establish an adjacency for some reason.

protocols-supported-mismatch: This notification is sent when the system receives a non pseudonode LSP that has no matching protocol supported.

lsp-error-detected: This notification is sent when the system receives a LSP with a parse error.

adjacency-state-change: This notification is sent when an IS-IS adjacency moves to Up state or to Down state.

lsp-received: This notification is sent when a LSP is received.

lsp-generation: This notification is sent when a LSP is regenerated.

5. Interaction with Other YANG Modules

The "isis" configuration container augments the "/rt:routing/rt:control-plane-protocols/control-plane-protocol" container of the ietf-routing [RFC8349] module by defining IS-IS specific parameters.

The "isis" module augments "/if:interfaces/if:interface" defined by [RFC8343] with ISO specific parameters.

The "isis" operational state container augments the "/rt:routing-state/rt:control-plane-protocols/control-plane-protocol" container of the ietf-routing module by defining IS-IS specific operational states.

Some IS-IS specific routes attributes are added to route objects of the ietf-routing module by augmenting "/rt:routing-state/rt:ribs/rt:rib/rt:routes/rt:route".

The modules defined in this document use some groupings from ietf-keychain [RFC8177].

The module reuses types from [RFC6991] and [RFC8294].
To support BFD for fast detection, the module relies on [I-D.ietf-bfd-yang].

6. IS-IS YANG Module

<CODE BEGINS> file "ietf-isis@2019-01-18.yang"

module ietf-isis {
    yang-version 1.1;
    namespace "urn:ietf:params:xml:ns:yang:ietf-isis";
    prefix isis;

    import ietf-routing {
        prefix "rt";
        reference "RFC 8349 - A YANG Data Model for Routing Management (NMDA Version)";
    }

    import ietf-inet-types {
        prefix inet;
        reference "RFC 6991 - Common YANG Data Types";
    }

    import ietf-yang-types {
        prefix yang;
        reference "RFC 6991 - Common YANG Data Types";
    }

    import ietf-interfaces {
        prefix "if";
        reference "RFC 8343 - A YANG Data Model for Interface Management (NDMA Version)";
    }

    import ietf-key-chain {
        prefix "key-chain";
        reference "RFC 8177 - YANG Data Model for Key Chains";
    }

    import ietf-routing-types {
        prefix "rt-types";
        reference "RFC 8294 - Common YANG Data Types for the Routing Area";
    }

    import iana-routing-types {
        prefix "iana-rt-types";
    }

<CODE ENDS>
This YANG module defines the generic configuration and operational state for the IS-IS protocol. It is intended that the module will be extended by vendors to define vendor-specific...
IS-IS configuration parameters and policies, for example route maps or route policies.

This YANG model conforms to the Network Management Datastore Architecture (NDMA) as described in RFC 8242.

7. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The Network Configuration Access Control Model (NACM) [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. For IS-IS, the ability to modify IS-IS configuration will allow the entire IS-IS domain to be compromised including creating adjacencies with unauthorized routers to misroute traffic, isolate routers, or mount a massive Denial-of-Service (DoS) attack. A user should consider all the configuration nodes are sensible.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. The exposure of the Link State Database (LSDB) will expose the detailed topology of the network including authentication parameters. Implementations MUST NOT
provide a configured authentication key in a clear text format in response to any request (e.g., via get, get-config).

For IS-IS authentication, configuration is supported via the specification of key-chain [RFC8177] or the direction specification of key and authentication algorithm. Hence, authentication configuration using the "auth-table-trailer" case in the "authentication" container inherits the security considerations of [RFC8177]. This includes the considerations with respect to the local storage and handling of authentication keys.

Some of the RPC operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. The OSPF YANG module support the "clear-adjacency" and "clear-database" RPCs. If access too either of these is compromised, they can result in temporary network outages be employed to mount DoS attacks.

8. Contributors

Authors would like to thank Kiran Agrahara Sreenivasa, Dean Bogdanovic, Yingzhen Qu, Yi Yang, Jeff Tanstura for their major contributions to the draft.

9. IANA Considerations

The IANA is requested to assign two new URIs from the IETF XML registry ([RFC3688]). Authors are suggesting the following URI:

```
Registrant Contact: IS-IS WG
XML: N/A, the requested URI is an XML namespace
```

This document also requests one new YANG module name in the YANG Module Names registry ([RFC6020]) with the following suggestion:

```
name: ietf-isis
prefix: isis
reference: RFC XXXX
```

10. Change log for ietf-isis YANG module

10.1. From version -29 to version -30

- Set a maximum-length of 255 for the non-best-reason leaf.
- Updated some descriptions.
o Renamed "level-db" container to "levels" for consistency reasons.

o Added some RFC references in the YANG model.

o Leaf default-metric of container prefix-ipv4-std is now a container.

o Changed the description of the authentication and removed the reference to MD5 as a possible way to hide the password.

o Changed leaf type for authentication type within tlv10-authentication container. Moved from string to keychain:crypto-algorithm identity.

o Some admin strings are now limited to a range of 1..255.

o Hostname string in hostname DB is limited to 255 as per RFC5301.

o In FRR stats, "prefix" is now encoded as inet:ip-prefix rather than a string. "alternate" is now encoded as ip-address.

10.2. From version -28 to version -29

o Fixed area-address type pattern. The authorized number of bytes was wrong.

10.3. From version -27 to version -28

o Fixed non accurate description of level-type leaf.

10.4. From version -26 to version -27

o Fixed XPATH to switching-capability leaf in "when" statement of psc-specific and tdm-specific containers.

10.5. From version -25 to version -26

o Modify BFD reference descriptions.

o Fix indentation.

o "uses interface-state" was missing.

10.6. From version -24 to version -25

o RPC clear-adjacency uses now an interface reference instead of a string.
- Use expanded "address-family" rather than "af" in the model.
- Fix pattern for area-address.
- Removed unnecessary identities.
- Added an instances container and list in the modeling of neighbors in the LSDB. This is to manage the case where there are parallel links between two neighbors.
- Notification instance header: removed routing-instance leaf (alignment with OSPF).
- Notification instance header: changed routing-protocol-name to a reference.
- Notification interface header: changed interface to a reference.
- RPCs: changed instance-state-ref typedef to a leafref. Removed associated typedef.
- Revised some groupings and their names (alignment with OSPF).
- Some description alignment with OSPF.
- auto-cost container alignment with OSPF.
- MT-ID leaf in database description renamed (lower-case) mt-id.
- In lsp-log grouping, leaf change is renamed reason to align with OSPF.
- Added some link attributes (GMPLS, TE, extended TE, SRLGs) in the LSDB.
- Added extended-system-id typedef which contains the systemid plus the pseudonode number.
- Add support of POI Purge Originator Identification.

10.7. From version -22 to version -24
- Fix revision date of the module.
10.8. From version -21 to version -22
   o TE router-id modeling alignment with OSPF.
   o Add max-ecmp + feature in spf-control container (alignment with OSPF).

10.9. From version -20 to version -21
   o Model revision date fix

10.10. From version -19 to version -20
   o Moved to Yang 1.1
   o Lower case enumerations
   o Add RFC references to features
   o Remove segment-routing feature
   o Modified BFD activation modeling

10.11. From version -18 to version -19
   o Align with draft-ietf-netmod-rfc8022bis.
   o Modify address family types as per draft-ietf-rtgwg-routing-types-17.

10.12. From version -17 to version -18
   o NMDA compliancy.
   o Set some default values.
   o Align with iana-rt-types module.

10.13. From version -16 to version -17
   o Cosmetic fixes.
   o Use of rt-types model.
10.14. From version -15 to version -16

- Alignment with last IETF key chain model.
- lsp-log "change" leaf moved as an identity.
- Incremental SPF removed from spf-log types.

10.15. From version -14 to version -15

- Alignment with OSPF model done:
  * Added spf-control container with IETF SPF delay algorithm as a feature.
  * Added graceful-restart options.
  * Added nsr as a feature.
  * Removed per topology FRR. Need to be augmented if necessary.
  * Created an ldp container within mpls.
  * Renamed igp-ldp-sync to igp-sync.
  * Added auto-cost container.
  * Moved reference-bandwidth under auto-cost container.
  * Added IS-IS local RIB as operational state.
  * Added decode-completed and raw-data leaves in the LSDB model.
  * Modified the notification header.

10.16. From version -13 to version -14

- Segment Routing extensions are now in a separate document.

10.17. From version -12 to version -13

- Move feature nlpid-control to container rather than list.
- Rename multi-topology to topologies to align with OSPF.
- Rename bfd/enabled to bfd/enable for consistency reason.
- Add support for NSR with a feature.
10.18. From version -09 to version -12
   o Rename node-tag container to node-tags.

10.19. From version -08 to version -09
   o Added container before af list.
   o Added container before topology list.
   o Aligned LFA if per level cfg.
   o Align to draft-ietf-netmod-routing-cfg-23.

10.20. From version -07 to version -08
   o Remove selector from system-id type.
   o Add some default values.
   o Moved lists to containers+groupings for per level configuration.
   o remove routing-instance as per core routing model v21.
   o added BFD leaf (no more BFD protocol model).
   o changed keychain module reference.

10.21. From version -05 to version -07
   o Move Overload config from list to container.
   o Move Overload-max-metric config from list to container.
   o Move preference config from list to container.
   o Add Node flag in config.
   o Removed BFD config => moved to isis-bfd module.
   o Remove call to routing policy model.

10.22. From version -03 to version -05
   o Correct invalid references to previous versions of core routing model.
   o Remove BFD config and replace by groupings from ietf-bfd.
10.23. From version -02 to version -03

- Adding routing-policy support through routing-policy model.
- Reviewed config and op state groupings.
- Add default value to lfa candidate-disabled.
- Add enable leaf to isis container to reflect admin state.
- Move to VRF centric only.
- Segment routing is part os a separate module.

10.24. From version -01 to version -02

- Adding IPFRR.
- Adding igp-ldp-sync.
- Adding segment-routing.
- Adding instance reference to operational states.
- Move AF type from string to identity.
- Updated router-capability in LSDB description.
- Packet counters moved to interface-packet-counters.
- Added modification information in lsp-log.
- Removing igp-ldp-sync timer in IS-IS.
- Defining hierarchy for operational states.
- Adding clns-mtu.
- Adding key-chain.

10.25. From version -00 to version -01

- Interface metric move from af container to interface container.
- Hello-padding on interface moved to hello-padding-disable with empty type.
- Three-way-handshake removed.
- route preference changed to a choice.
- csnp-authentication/psnp-authentication merged to authentication container.
- lsp-gen-interval-exp-delay removed.
- Added overload-max-metric feature.
- overload-max-metric is in a separate container.
- Change hello-padding to container.
- Change bfd to container.
- Make BFD a feature.
- Create mpls-te container and put router-id inside.
- Remove GR helper disable and timers.
