SSH Client and Server Models
draft-ietf-netconf-ssh-client-server-01

Abstract

This document defines two YANG modules, one defines groupings for a generic SSH client and the other defines groupings for a generic SSH server. It is intended that these groupings will be used by applications using the SSH protocol.

Editorial Note (To be removed by RFC Editor)

This draft contains many placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

This document contains references to other drafts in progress, both in the Normative References section, as well as in body text throughout. Please update the following references to reflect their final RFC assignments:

- draft-ietf-netconf-keystore

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

- "XXXX" --> the assigned RFC value for this draft
- "YYYY" --> the assigned RFC value for draft-ietf-netconf-keystore

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

- "2016-11-02" --> the publication date of this draft

The following two Appendix sections are to be removed prior to publication:

- Appendix A. Change Log
Appendix B. Open Issues

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on May 7, 2017.

1. Introduction

This document defines two YANG [RFC6020] modules, one defines groupings for a generic SSH client and the other defines groupings for a generic SSH server (SSH is defined in [RFC4252], [RFC4253], and [RFC4254]). It is intended that these groupings will be used by applications using the SSH protocol. For instance, these groupings could be used to help define the data model for an OpenSSH [OPENSSH] server or a NETCONF over SSH [RFC6242] based server.

The two YANG modules in this document each define two groupings. One grouping defines everything other than what’s needed for the TCP [RFC793] protocol layer. The other grouping uses the first grouping while adding TCP layer specifics (e.g., addresses to connect to, ports to listen on, etc.). This separation is done in order to enable applications the opportunity to define their own strategy for how the underlying TCP connection is established. For instance, applications supporting NETCONF Call Home [draft-ietf-netconf-call-home] could use the first grouping for the SSH parts it provides, while adding data nodes for the reversed TCP layer.

1.1. Terminology

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

1.2. Tree Diagrams

A simplified graphical representation of the data models is used in this document. The meaning of the symbols in these diagrams is as follows:

- Brackets "[" and "]" enclose list keys.
2. The SSH Client Model

The SSH client model presented in this section contains two YANG groupings, one for a client that initiates the underlying TCP connection and another for a client that has had the TCP connection opened for it already (e.g., call home).

Both of these groupings reference data nodes defined by the Keystore model [draft-ietf-netconf-keystore]. For instance, a reference to the keystore model is made to indicate which trusted CA certificate a client should use to authenticate X.509v3 certificate based host keys [RFC6187].

2.1. Tree Diagram

The following tree diagram presents the data model for the two groupings defined in the ietf-ssh-client module.
module: ietf-ssh-client

groupings:
initiating-ssh-client-grouping
   +---- server-auth
       | +---- trusted-ssh-host-keys? -> /ks:keystore/trusted-ssh-host-keys/name
       | +---- trusted-ca-certs?  -> /ks:keystore/trusted-certificates/name {ssh-x509-certs}?
       | +---- trusted-server-certs? -> /ks:keystore/trusted-certificates/name
   +---- client-auth
       +---- matches* [name]
            +---- name?  string
            +---- match* [name]
                | +---- name?  string
                | +---- trusted-ssh-host-keys? -> /ks:keystore/trusted-ssh-host-keys/name
                | +---- trusted-ca-certs?  -> /ks:keystore/trusted-certificates/name
                | +---- trusted-server-certs? -> /ks:keystore/trusted-certificates/name
       +---- user-auth-credentials? -> /ks:keystore/user-auth-credentials/user-auth-credential/username

listening-ssh-client-grouping
   +---- address?  inet:ip-address
   +---- port?     inet:port-number
   +---- server-auth
       | +---- trusted-ssh-host-keys? -> /ks:keystore/trusted-ssh-host-keys/name
       | +---- trusted-ca-certs?  -> /ks:keystore/trusted-certificates/name
       | +---- trusted-server-certs? -> /ks:keystore/trusted-certificates/name
   +---- client-auth
       +---- matches* [name]
            +---- name?  string
            +---- match* [name]
                | +---- name?  string
                | +---- trusted-ssh-host-keys? -> /ks:keystore/trusted-ssh-host-keys/name
                | +---- trusted-ca-certs?  -> /ks:keystore/trusted-certificates/name
                | +---- trusted-server-certs? -> /ks:keystore/trusted-certificates/name
       +---- user-auth-credentials? -> /ks:keystore/user-auth-credentials/user-auth-credential/username
2.2. Example Usage

This section shows how it would appear if the initiating-ssh-client-grouping were populated with some data. This example is consistent with the examples presented in Section 2.2 of [draft-ietf-netconf-keystore].

FIXME (how to do an example for a module that only has groupings?)

2.3. YANG Model

This YANG module has a normative references to [RFC6991] and [draft-ietf-netconf-keystore].

<CODE ENDS>
3. The SSH Server Model

The SSH server model presented in this section contains two YANG groupings, one for a server that opens a socket to accept TCP connections and another for a server that has had the TCP connection opened for it already (e.g., inetd).

Both of these groupings reference data nodes defined by the Keystore model [draft-ietf-netconf-keystore]. For instance, a reference to the keyStore model is made to indicate which host key a server should present.

3.1. Tree Diagram

The following tree diagram presents the data model for the two groupings defined in the ietf-ssh-server module.
module: ietf-ssh-server
  groupings:
    listening-ssh-server-grouping
      +---- address?            inet:ip-address
      +---- port?               inet:port-number
      +---- host-keys
        |  +---- host-key* [name]
        |     +---- name?          string
        |     +---- (host-key-type)
        |     +--:(public-key)
        |        |  +---- public-key?    -> /ks:keystore/private-keys/private-key/name
        |     +--:(certificate)
        |        |  +---- certificate?   -> /ks:keystore/private-keys/private-key/certificate-chains/certificate-chain/name {ssh-x509-certs}?
        |     +---- client-cert-auth {ssh-x509-certs}?
        |     +---- trusted-ca-certs?       -> /ks:keystore/trusted-certificates/name
        |     +---- trusted-client-certs?   -> /ks:keystore/trusted-certificates/name
    non-listening-ssh-server-grouping
      +---- host-keys
        |  +---- host-key* [name]
        |     +---- name?          string
        |     +---- (host-key-type)
        |     +--:(public-key)
        |        |  +---- public-key?    -> /ks:keystore/private-keys/private-key/name
        |     +--:(certificate)
        |        |  +---- certificate?   -> /ks:keystore/private-keys/private-key/certificate-chains/certificate-chain/name {ssh-x509-certs}?
        |     +---- client-cert-auth {ssh-x509-certs}?
        |     +---- trusted-ca-certs?       -> /ks:keystore/trusted-certificates/name
        |     +---- trusted-client-certs?   -> /ks:keystore/trusted-certificates/name

3.2. Example Usage

This section shows how it would appear if the listening-ssh-server-grouping were populated with some data. This example is consistent with the examples presented in Section 2.2 of [draft-ietf-netconf-keystore].
<listening-ssh-server
  xmlns="urn:ietf:params:xml:ns:yang:ietf-ssh-server">
  <port>830</port>
  <host-keys>
    <host-key>
      <name>deployment-specific-certificate</name>
      <certificate>ex-key-sect571r1-cert</certificate>
    </host-key>
  </host-keys>
</listening-ssh-server>

3.3. YANG Model
