YANG Groupings for SSH Clients and SSH Servers
draft-ietf-netconf-ssh-client-server-08

Abstract

This document defines three YANG modules: the first defines groupings for a generic SSH client, the second defines groupings for a generic SSH server, and the third defines common identities and groupings used by both the client and the server. It is intended that these groupings will be used by applications using the SSH protocol.

Editorial Note (To be removed by RFC Editor)

This draft contains many placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

This document contains references to other drafts in progress, both in the Normative References section, as well as in body text throughout. Please update the following references to reflect their final RFC assignments:

  o I-D.ietf-netconf-trust-anchors
  o I-D.ietf-netconf-keystore

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

  o "XXXX" --> the assigned RFC value for this draft
  o "YYYY" --> the assigned RFC value for I-D.ietf-netconf-trust-anchors
  o "ZZZZ" --> the assigned RFC value for I-D.ietf-netconf-keystore

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:
The following Appendix section is to be removed prior to publication:

- Appendix A. Change Log

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on April 25, 2019.

1. Introduction

This document defines three YANG 1.1 [RFC7950] modules: the first defines a grouping for a generic SSH client, the second defines a grouping for a generic SSH server, and the third defines identities and groupings common to both the client and the server. It is intended that these groupings will be used by applications using the SSH protocol [RFC4252], [RFC4253], and [RFC4254]. For instance, these groupings could be used to help define the data model for an OpenSSH [OPENSSH] server or a NETCONF over SSH [RFC6242] based server.

The client and server YANG modules in this document each define one grouping, which is focused on just SSH-specific configuration, and specifically avoids any transport-level configuration, such as what ports to listen on or connect to. This affords applications the opportunity to define their own strategy for how the underlying TCP connection is established. For instance, applications supporting NETCONF Call Home [RFC8071] could use the "ssh-server-grouping" grouping for the SSH parts it provides, while adding data nodes for the TCP-level call-home configuration.
The modules defined in this document uses groupings defined in [I-D.ietf-netconf-keystore] enabling keys to be either locally defined or a reference to globally configured values.

The modules defined in this document optionally support [RFC6187] enabling X.509v3 certificate based host keys and public keys.

2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

3. The SSH Client Model

3.1. Tree Diagram

This section provides a tree diagram [RFC8340] for the "ietf-ssh-client" module that does not have groupings expanded.
3.2. Example Usage

This section presents two examples showing the ssh-client-grouping populated with some data. These examples are effectively the same except the first configures the client identity using a local key while the second uses a key configured in a keystore. Both examples are consistent with the examples presented in Section 3 of [I-D.ietf-netconf-trust-anchors] and Section 3.2 of [I-D.ietf-netconf-keystore].

The following example configures the client identity using a local key:
[Note: '\' line wrapping for formatting only]

```xml
<ssh-client
  xmlns="urn:ietf:params:xml:ns:yang:ietf-ssh-client"
  <!-- how this client will authenticate itself to the server -->
  <client-identity>
    <username>foobar</username>
    <public-key>
      <private-key>base64encodedvalue==</private-key>
      <public-key>base64encodedvalue==</public-key>
    </public-key>
  </client-identity>

  <!-- which host-keys will this client trust -->
  <server-auth>
    <pinned-ssh-host-keys>explicitly-trusted-ssh-host-keys</pinned-ssh-host-keys>
  </server-auth>

  <transport-params>
    <host-key>
      <host-key-alg>algs:ssh-rsa</host-key-alg>
    </host-key>
    <key-exchange>
      <key-exchange-alg>algs:diffie-hellman-group-exchange-sha256</key-exchange-alg>
    </key-exchange>
    <encryption>
      <encryption-alg>algs:aes256-ctr</encryption-alg>
      <encryption-alg>algs:aes192-ctr</encryption-alg>
      <encryption-alg>algs:aes128-ctr</encryption-alg>
      <encryption-alg>algs:aes256-cbc</encryption-alg>
      <encryption-alg>algs:aes192-cbc</encryption-alg>
      <encryption-alg>algs:aes128-cbc</encryption-alg>
    </encryption>
    <mac>
      <mac-alg>algs:hmac-sha2-256</mac-alg>
      <mac-alg>algs:hmac-sha2-512</mac-alg>
    </mac>
  </transport-params>
</ssh-client>
```
The following example configures the client identity using a key from the keystore:

[Note: ‘\’ line wrapping for formatting only]

```xml
<ssh-client
 xmlns="urn:ietf:params:xml:ns:yang:ietf-ssh-client"
 <!-- how this client will authenticate itself to the server -->
 <client-identity>
   <username>foobar</username>
   <public-key>
     <reference>ex-rsa-key</reference>
   </public-key>
 </client-identity>

 <!-- which host-keys will this client trust -->
 <server-auth>
   <pinned-ssh-host-keys>explicitly-trusted-ssh-host-keys</pinned-ssh-host-keys>
 </server-auth>

 <transport-params>
   <host-key>
     <host-key-alg>ssh-rsa</host-key-alg>
   </host-key>
   <key-exchange>
     <key-exchange-alg>
       <algs:diffie-hellman-group-exchange-sha256
     </key-exchange-alg>
   </key-exchange>
   <encryption>
     <encryption-alg>aes256-ctr</encryption-alg>
     <encryption-alg>aes192-ctr</encryption-alg>
     <encryption-alg>aes128-ctr</encryption-alg>
     <encryption-alg>aes256-cbc</encryption-alg>
     <encryption-alg>aes192-cbc</encryption-alg>
     <encryption-alg>aes128-cbc</encryption-alg>
   </encryption>
   <mac>
     <mac-alg>hmac-sha2-256</mac-alg>
     <mac-alg>hmac-sha2-512</mac-alg>
   </mac>
 </transport-params>
</ssh-client>
```
3.3. YANG Module

This YANG module has normative references to
[I-D.ietf-netconf-trust-anchors], and [I-D.ietf-netconf-keystore].

      +-- (host-key-type)
        +--:(public-key)
          +-- public-key
            +--u server-identity-grouping
            +--:(certificate)
              +-- certificate {sshcmn:ssh-x509-certs}?
                +--u server-identity-grouping

grouping ssh-server-grouping
  +--u server-identity-grouping
  +--u client-auth-grouping
  +--u transport-params-grouping
```

4.2. Example Usage

This section presents two examples showing the ssh-server-grouping populated with some data. These examples are effectively the same except the first configures the server identity using a local key while the second uses a key configured in a keystore. Both examples are consistent with the examples presented in Section 3 of
[I-D.ietf-netconf-trust-anchors] and Section 3.2 of [I-D.ietf-netconf-keystore].

The following example configures the server identity using a local key:

[Note: ‘\’ line wrapping for formatting only]

```xml
<ssh-server xmlns="urn:ietf:params:xml:ns:yang:ietf-ssh-server"
  <!-- which host-keys will this SSH server present -->
  <server-identity>
    <host-key>
      <name>deployment-specific-certificate</name>
      <public-key>
        <private-key>base64encodedvalue==</private-key>
        <public-key>base64encodedvalue==</public-key>
      </public-key>
    </host-key>
    <!-- which client-certs will this SSH server trust -->
    <client-cert-auth>
      <pinned-ca-certs>explicitly-trusted-client-ca-certs</pinned-ca-certs>
      <pinned-client-certs>explicitly-trusted-client-certs</pinned-client-certs>
    </client-cert-auth>
    <transport-params>
      <host-key>
        <host-key-alg>algs:ssh-rsa</host-key-alg>
      </host-key>
      <key-exchange>
        <key-exchange-alg>algs:diffie-hellman-group-exchange-sha256</key-exchange-alg>
      </key-exchange>
      <encryption>
        <encryption-alg>algs:aes256-ctr</encryption-alg>
        <encryption-alg>algs:aes192-ctr</encryption-alg>
        <encryption-alg>algs:aes128-ctr</encryption-alg>
        <encryption-alg>algs:aes256-cbc</encryption-alg>
        <encryption-alg>algs:aes192-cbc</encryption-alg>
      </encryption>
    </transport-params>
  </server-identity>
</ssh-server>
```
<encryption-alg>algs:aes128-cbc</encryption-alg>
</encryption>
<mac>
  <mac-alg>algs:hmac-sha2-256</mac-alg>
  <mac-alg>algs:hmac-sha2-512</mac-alg>
</mac>
</transport-params>
</ssh-server>

The following example configures the server identity using a key from the keystore:
<ssh-server xmlns="urn:ietf:params:xml:ns:yang:ietf-ssh-server"

<!-- which host-keys will this SSH server present -->
<server-identity>
    <host-key>
        <name>deployment-specific-certificate</name>
        <public-key>
            <reference>ex-rs-a-key</reference>
        </public-key>
    </host-key>
</server-identity>

<!-- which client-certs will this SSH server trust -->
<client-cert-auth>
    <pinned-ca-certs>explicitly-trusted-client-ca-certs</pinned-ca-certs>
    <pinned-client-certs>explicitly-trusted-client-certs</pinned-client-certs>
</client-cert-auth>

<transport-params>
    <host-key>
        <host-key-alg>algs:ssh-rsa</host-key-alg>
    </host-key>
    <key-exchange>
        <key-exchange-alg>
            algs:diffie-hellman-group-exchange-sha256
        </key-exchange-alg>
    </key-exchange>
    <encryption>
        <encryption-alg>algs:aes256-ctr</encryption-alg>
        <encryption-alg>algs:aes192-ctr</encryption-alg>
        <encryption-alg>algs:aes128-ctr</encryption-alg>
        <encryption-alg>algs:aes256-cbc</encryption-alg>
        <encryption-alg>algs:aes192-cbc</encryption-alg>
        <encryption-alg>algs:aes128-cbc</encryption-alg>
    </encryption>
    <mac>
        <mac-alg>algs:hmac-sha2-256</mac-alg>
        <mac-alg>algs:hmac-sha2-512</mac-alg>
    </mac>
</transport-params>

</ssh-server>

5. The SSH Common Model

The SSH common model presented in this section contains identities and groupings common to both SSH clients and SSH servers. The transport-params-grouping can be used to configure the list of SSH transport algorithms permitted by the SSH client or SSH server. The lists of algorithms are ordered such that, if multiple algorithms are permitted by the client, the algorithm that appears first in its list that is also permitted by the server is used for the SSH transport layer connection. The ability to restrict the algorithms allowed is provided in this grouping for SSH clients and SSH servers that are capable of doing so and may serve to make SSH clients and SSH servers compliant with security policies.

[I-D.ietf-netconf-crypto-types] defines six categories of cryptographic algorithms (hash-algorithm, symmetric-key-encryption-algorithm, mac-algorithm, asymmetric-key-encryption-algorithm, signature-algorithm, key-negotiation-algorithm) and lists several widely accepted algorithms for each of them. The SSH client and server models use one or more of these algorithms. The SSH common model includes four parameters for configuring its permitted SSH algorithms, which are: host-key-alg, key-exchange-alg, encryption-alg and mac-alg. The following tables are provided, in part, to define the subset of algorithms defined in the crypto-types model used by SSH and, in part, to ensure compatibility of configured SSH cryptographic parameters for configuring its permitted SSH algorithms ("sshcmn" representing SSH common model, and "ct" representing crypto-types model which the SSH client/server model is based on):
### Table 1 The SSH Host-key-alg Compatibility Matrix

<table>

<td>aes-256-ctr</td>
</tr>
</tbody>
</table>
As is seen in the tables above, the names of the "sshcmn" algorithms are all identical to the names of algorithms defined in [I-D.ietf-netconf-crypto-types]. While appearing to be redundant, it is important to realize that not all the algorithms defined in [I-D.ietf-netconf-crypto-types] are supported by SSH. That is, the algorithms supported by SSH are a subset of the algorithms defined in [I-D.ietf-netconf-crypto-types]. The algorithms used by SSH are redefined in this document in order to constrain the algorithms that may be selected to just the ones used by SSH.

Features are defined for algorithms that are OPTIONAL or are not widely supported by popular implementations. Note that the list of algorithms is not exhaustive. As well, some algorithms that are REQUIRED by [RFC4253] are missing, notably "ssh-dss" and "diffie-hellman-group1-sha1" due to their weak security and there being alternatives that are widely supported.

5.1. Tree Diagram

The following tree diagram [RFC8340] provides an overview of the data model for the "ietf-ssh-common" module.

```
module: ietf-ssh-common

  grouping transport-params-grouping
    +-+- host-key
    | | +- host-key-alg* identityref
    +- key-exchange
      | | +- key-exchange-alg* identityref
      +- encryption
        | | +- encryption-alg* identityref
        +- mac
          | | +- mac-alg* identityref
```
5.2. Example Usage

This following example illustrates how the transport-params-grouping appears when populated with some data.

```xml
<transport-params
    xmlns="urn:ietf:params:xml:ns:yang:ietf-ssh-common"
    <host-key>
        <host-key-alg>algs:x509v3-rsa2048-sha256</host-key-alg>
        <host-key-alg>algs:ssh-rsa</host-key-alg>
    </host-key>
    <key-exchange>
        <key-exchange-alg>
            algs:diffie-hellman-group-exchange-sha256
        </key-exchange-alg>
    </key-exchange>
    <encryption>
        <encryption-alg>algs:aes256-ctr</encryption-alg>
        <encryption-alg>algs:aes192-ctr</encryption-alg>
        <encryption-alg>algs:aes128-ctr</encryption-alg>
        <encryption-alg>algs:aes256-cbc</encryption-alg>
        <encryption-alg>algs:aes192-cbc</encryption-alg>
        <encryption-alg>algs:aes128-cbc</encryption-alg>
    </encryption>
    <mac>
        <mac-alg>algs:hmac-sha2-256</mac-alg>
        <mac-alg>algs:hmac-sha2-512</mac-alg>
    </mac>
</transport-params>
```

5.3. YANG Module

This YANG module has normative references to [RFC4253], [RFC4344], [RFC4419], [RFC5656], [RFC6187], and [RFC6668].

6. Security Considerations

The YANG modules defined in this document are designed to be accessed via YANG based management protocols, such as NETCONF [RFC6241] and RESTCONF [RFC8040]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TLS) with mutual authentication.

The NETCONF access control model (NACM) [RFC8341] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the modules defined in this document define only groupings, these considerations are primarily for the designers of other modules that use these groupings.

There are a number of data nodes defined in the YANG modules that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

/:
The entire data tree defined by all the modules defined in this draft are sensitive to write operations. For instance, the addition or removal of references to keys, certificates, trusted anchors, etc., can dramatically alter the implemented
security policy. However, no NACM annotations are applied as the data SHOULD be editable by users other than a designated 'recovery session'.

Some of the readable data nodes in the YANG modules may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

/\client-auth/password: This node in the 'ietf-ssh-client' module is additionally sensitive to read operations such that, in normal use cases, it should never be returned to a client. The only time this node should be returned is to support backup/restore type workflows. However, no NACM annotations are applied as the data SHOULD be writable by users other than a designated 'recovery session'.

Some of the RPC operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

NONE

7. IANA Considerations

7.1. The IETF XML Registry

This document registers three URIs in the "ns" subregistry of the IETF XML Registry [RFC3688]. Following the format in [RFC3688], the following registrations are requested:

Registrant Contact: The NETCONF WG of the IETF.
XML: N/A, the requested URI is an XML namespace.

Registrant Contact: The NETCONF WG of the IETF.
XML: N/A, the requested URI is an XML namespace.

Registrant Contact: The NETCONF WG of the IETF.
XML: N/A, the requested URI is an XML namespace.

7.2. The YANG Module Names Registry

This document registers three YANG modules in the YANG Module Names registry [RFC6020]. Following the format in [RFC6020], the following registrations are requested:

Appendix A. Change Log

A.1. 00 to 01

- Noted that ‘0.0.0.0’ and ‘::’ might have special meanings.
- Renamed "keychain" to "keystore".

A.2. 01 to 02

- Removed the groupings ‘listening-ssh-client-grouping’ and ‘listening-ssh-server-grouping’. Now modules only contain the transport-independent groupings.
- Simplified the "client-auth" part in the ietf-ssh-client module. It now inlines what it used to point to keystore for.
- Added cipher suites for various algorithms into new ‘ietf-ssh-common’ module.

A.3. 02 to 03

- Removed ‘RESTRICTED’ enum from ‘password’ leaf type.
- Added a ‘must’ statement to container ‘server-auth’ asserting that at least one of the various auth mechanisms must be specified.
- Fixed description statement for leaf ‘trusted-ca-certs’.

A.4. 03 to 04

- Change title to "YANG Groupings for SSH Clients and SSH Servers"
- Added reference to RFC 6668
- Added RFC 8174 to Requirements Language Section.
- Enhanced description statement for ietf-ssh-server’s "trusted-ca-certs" leaf.
- Added mandatory true to ietf-ssh-client’s "client-auth" ‘choice’ statement.
- Changed the YANG prefix for module ietf-ssh-common from ‘sshcom’ to ‘sshcmn’.
- Removed the compression algorithms as they are not commonly configurable in vendors’ implementations.
Internet-Draft    Groupings for SSH Clients and Servers     October 2018

- Updating descriptions in transport-params-grouping and the
  servers’s usage of it.
- Now tree diagrams reference ietf-netmod-yang-tree-diagrams
- Updated YANG to use typedefs around leafrefs to common keystore
  paths
- Now inlines key and certificates (no longer a leafref to keystore)

A.5. 04 to 05

- Merged changes from co-author.

A.6. 05 to 06

- Updated to use trust anchors from trust-anchors draft (was
  keystore draft)
- Now uses new keystore grouping enabling asymmetric key to be
  either locally defined or a reference to the keystore.

A.7. 06 to 07

- factored the ssh-[client|server]-groupings into more reusable
  groupings.
- added if-feature statements for the new "ssh-host-keys" and
  "x509-certificates" features defined in draft-ietf-netconf-trust-
  anchors.

A.8. 07 to 08

- Added a number of compatibility maeticies to Section 5 (thanks
  Frank!)
- Clarified that any configured "host-key-alg" values need to be
  compatible with the configured private key.
