Abstract

This document defines three YANG modules: the first defines a grouping for configuring a generic TCP client, the second defines a grouping for configuring a generic TCP server, and the third defines a grouping common to the TCP clients and TCP servers.

Editorial Note (To be removed by RFC Editor)

This draft contains many placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

Artwork in this document contains placeholder values for the date of publication of this draft. Please apply the following replacement:

- "2019-07-02" --> the publication date of this draft

The following Appendix section is to be removed prior to publication:

- Appendix A. Change Log

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."
This Internet-Draft will expire on January 3, 2020.

1. Introduction

This document defines three YANG 1.1 [RFC7950] modules: the first defines a grouping for configuring a generic TCP client, the second defines a grouping for configuring a generic TCP server, and the third defines a grouping common to the TCP clients and TCP servers.

It is intended that these groupings will be used either standalone, for TCP-based protocols, as part of a stack of protocol-specific configuration models. For instance, these groupings could help define the configuration module for SSH, TLS, or HTTP based applications.

2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

3. The TCP Client Model

3.1. Tree Diagram

This section provides a tree diagram [RFC8340] for the "ietf-tcp-client" module.

```
module: ietf-tcp-client

grouping tcp-client-grouping
  +- remote-address    inet:host
  +- remote-port?      inet:port-number
  +- local-address?    inet:ip-address {local-binding-supported}?
  +- local-port?       inet:port-number {local-binding-supported}?
  +- keepalives! {keepalives-supported}?
    +- idle-time        uint16
    +- max-probes       uint16
    +- probe-interval   uint16
```

3.2. Example Usage

This section presents an example showing the tcp-client-grouping populated with some data.
  <remote-address>www.example.com</remote-address>
  <remote-port>443</remote-port>
  <local-address>0.0.0.0</local-address>
  <local-port>0</local-port>
  <keepalives>
    <idle-time>15</idle-time>
    <max-probes>3</max-probes>
    <probe-interval>30</probe-interval>
  </keepalives>
</tcp-client>

### 3.3. YANG Module

The `ietf-tcp-client` YANG module references [RFC6991].

```
<CODE BEGINS> file "ietf-tcp-client@2019-07-02.yang"
module ietf-tcp-client {
  yang-version 1.1;
  prefix tcpc;

  import ietf-inet-types {
    prefix inet;
    reference "RFC 6991: Common YANG Data Types";
  }

  import ietf-tcp-common {
    prefix tcpcmn;
    reference "RFC XXXX: YANG Groupings for TCP Clients and TCP Servers";
  }

  organization
    "IETF NETCONF (Network Configuration) Working Group and the IETF TCP Maintenance and Minor Extensions (TCPM) Working Group";

  contact
    "WG Web: <http://datatracker.ietf.org/wg/netconf/>
    <http://datatracker.ietf.org/wg/tcpm/>
    WG List: <mailto:netconf@ietf.org>
    <mailto:tcpm@ietf.org>
    Authors: Kent Watsen <mailto:kent+ietf@watsen.net>
    Michael Scharf <mailto:michael.scharf@hs-esslingen.de>";

  description
```

This module defines reusable groupings for TCP clients that can be used as a basis for specific TCP client instances.

  description
    "Initial version";
  reference
    "RFC XXXX: YANG Groupings for TCP Clients and TCP Servers";
}

// Features

feature local-binding-supported {
  description
    "Indicates that the server supports configuring local bindings (i.e., the local address and local port) for TCP clients.";
}

feature tcp-client-keepalives {
  description
    "Per socket TCP keepalive parameters are configurable for TCP clients on the server implementing this feature.";
}

// Groupings
grouping tcp-client-grouping {
  description "A reusable grouping for configuring a TCP client."

  Note that this grouping uses fairly typical descendent node names such that a stack of ‘uses’ statements will have name conflicts. It is intended that the consuming data model will resolve the issue (e.g., by wrapping the ‘uses’ statement in a container called ‘tcp-client-parameters’). This model purposely does not do this itself so as to provide maximum flexibility to consuming models."

  leaf remote-address {
    type inet:host;
    mandatory true;
    description "The IP address or hostname of the remote peer to establish a connection with. If a domain name is configured, then the DNS resolution should happen on each connection attempt. If the the DNS resolution results in multiple IP addresses, the IP addresses are tried according to local preference order until a connection has been established or until all IP addresses have failed."
  }

  leaf remote-port {
    type inet:port-number;
    default "0";
    description "The IP port number for the remote peer to establish a connection with. An invalid default value (0) is used (instead of ‘mandatory true’) so that as application level data model may ‘refine’ it with an application specific default port number value."
  }

  leaf local-address {
    if-feature "local-binding-supported";
    type inet:ip-address;
    description "The local IP address/interface (VRF?) to bind to for when connecting to the remote peer. INADDR_ANY (‘0.0.0.0’) or INADDR6_ANY (‘0:0:0:0:0:0:0:0’ a.k.a. ‘::’) MAY be used to explicitly indicate the implicit default, that the server can bind to any IPv4 or IPv6 addresses, respectively."
  }

  leaf local-port {
    if-feature "local-binding-supported";
}
4. The TCP Server Model

4.1. Tree Diagram

This section provides a tree diagram [RFC8340] for the "ietf-tcp-server" module.

module: ietf-tcp-server

grouping tcp-server-grouping
  +- local-address    inet:ip-address
  +- local-port?      inet:port-number
  +- keepalives! {keepalives-supported}?
    +- idle-time         uint16
    +- max-probes        uint16
    +- probe-interval    uint16

4.2. Example Usage

This section presents an example showing the tcp-server-grouping populated with some data.
4.3. YANG Module

The ietf-tcp-server YANG module references [RFC6991].

<CODE BEGINS> file "ietf-tcp-server@2019-07-02.yang"
module ietf-tcp-server {
    yang-version 1.1;

*/

<CODE ENDS>

6. Security Considerations

The YANG modules defined in this document are designed to be accessed via YANG based management protocols, such as NETCONF [RFC6241] and RESTCONF [RFC8040]. Both of these protocols have mandatory-to-implement secure transport layers (e.g., SSH, TCP) with mutual authentication.

The NETCONF access control model (NACM) [RFC8341] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the modules defined in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

There are a number of data nodes defined in the YANG modules that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

None of the writable/creatable/deletable data nodes in the YANG modules defined in this document are considered more sensitive or vulnerable then standard configuration.

Some of the readable data nodes in the YANG modules may be considered sensitive or vulnerable in some network environments. It is thus
important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

None of the readable data nodes in the YANG modules defined in this document are considered more sensitive or vulnerable than standard configuration.

This document does not define any RPC actions and hence this section does not consider the security of RPCs.

7. IANA Considerations

7.1. The IETF XML Registry

This document registers two URIs in the "ns" subregistry of the IETF XML Registry [RFC3688]. Following the format in [RFC3688], the following registrations are requested:

- **URI:** urn:ietf:params:xml:ns:yang:ietf-tcp-client
  - Registrant Contact: The NETCONF WG of the IETF.
  - XML: N/A, the requested URI is an XML namespace.

- **URI:** urn:ietf:params:xml:ns:yang:ietf-tcp-server
  - Registrant Contact: The NETCONF WG of the IETF.
  - XML: N/A, the requested URI is an XML namespace.

7.2. The YANG Module Names Registry

This document registers two YANG modules in the YANG Module Names registry [RFC6020]. Following the format in [RFC6020], the following registrations are requested:

- **name:** ietf-tcp-common
  - prefix: tcpcmn
  - reference: RFC XXXX

- **name:** ietf-tcp-client
  - prefix: tcpc
  - reference: RFC XXXX

- **name:** ietf-tcp-server
  - prefix: tcps
  - reference: RFC XXXX
8. References

8.1. Normative References

8.2. Informative References

Appendix A. Change Log

A.1. 00 to 01

- Added 'local-binding-supported' feature to TCP-client model.
- Added 'keepalives-supported' feature to TCP-common model.
- Added 'external-endpoint-values' container and 'external-endpoints' feature to TCP-server model.

A.2. 01 to 02

- Removed the 'external-endpoint-values' container and 'external-endpoints' feature from the TCP-server model.
