YANG Groupings for TCP Clients and TCP Servers
draft-ietf-netconf-tcp-client-server-03

Abstract

This document defines three YANG modules: the first defines a
grouping for configuring a generic TCP client, the second defines a
grouping for configuring a generic TCP server, and the third defines
a grouping common to the TCP clients and TCP servers.

Editorial Note (To be removed by RFC Editor)

This draft contains many placeholder values that need to be replaced
with finalized values at the time of publication. This note
summarizes all of the substitutions that are needed. No other RFC
Editor instructions are specified elsewhere in this document.

Artwork in this document contains placeholder values for the date of
publication of this draft. Please apply the following replacement:

- "2019-10-18" --> the publication date of this draft

The following Appendix section is to be removed prior to publication:

- Appendix A. Change Log

Status of This Memo

This Internet-Draft is submitted in full conformance with the
provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering
Task Force (IETF). Note that other groups may also distribute
working documents as Internet-Drafts. The list of current Internet-
Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months
and may be updated, replaced, or obsoleted by other documents at any
time. It is inappropriate to use Internet-Drafts as reference
material or to cite them other than as "work in progress."

1. Introduction

This document defines three YANG 1.1 [RFC7950] modules: the first defines a grouping for configuring a generic TCP client, the second defines a grouping for configuring a generic TCP server, and the third defines a grouping common to the TCP clients and TCP servers.

It is intended that these groupings will be used either standalone, for TCP-based protocols, as part of a stack of protocol-specific configuration models. For instance, these groupings could help define the configuration module for SSH, TLS, or HTTP based applications.

2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

3. The TCP Common Model

3.1. Model Scope

This document defines a common "grouping" statement for basic TCP connection parameters that matter to applications. In some TCP stacks, such parameters can also directly be set by an application using system calls, such as the socket API. The base YANG model in this document focuses on modeling TCP keep-alives. This base model can be extended as needed.

3.2. Usage Guidelines for Configuring TCP Keep-Alives

Network stacks may include "keep-alives" in their TCP implementations, although this practice is not universally accepted. If keep-alives are included, [RFC1122] [RFC793bis] mandates that the application MUST be able to turn them on or off for each TCP connection, and that they MUST default to off.

Keep-alive mechanisms exist in many protocols. Depending on the protocol stack, TCP keep-alives may only be one out of several alternatives. Which mechanism to use depends on the use case and application requirements. If keep-alives are needed by an application, it is RECOMMENDED that the aliveness check happens at the highest protocol layer possible that is meaningful to the application, in order to maximize the depth of the aliveness check.
A TCP keep-alive mechanism should only be invoked in server applications that might otherwise hang indefinitely and consume resources unnecessarily if a client crashes or aborts a connection during a network failure [RFC1122]. TCP keep-ales may consume significant resources both in the network and in endpoints (e.g., battery power). In addition, frequent keep-ales risk network congestion. The higher the frequency of keep-ales, the higher the overhead.

Given the cost of keep-ales, parameters have to be configured carefully:

- The default idle interval (leaf "idle-time") MUST default to no less than two hours, i.e., 7200 seconds [RFC1122]. A lower value MAY be configured, but keep-alive messages SHOULD NOT be transmitted more frequently than once every 15 seconds. Longer intervals SHOULD be used when possible.

- The maximum number of sequential keep-alive probes that can fail (leaf "max-probes") trades off responsiveness and robustness against packet loss. ACK segments that contain no data are not reliably transmitted by TCP. Consequently, if a keep-alive mechanism is implemented it MUST NOT interpret failure to respond to any specific probe as a dead connection [RFC1122]. Typically a single-digit number should suffice.

- TCP implementations may include a parameter for the number of seconds between TCP keep-alive probes (leaf "probe-interval"). In order to avoid congestion, the time interval between probes MUST NOT be smaller than one second. Significantly longer intervals SHOULD be used. It is important to note that keep-alive probes (or replies) can get dropped due to network congestion. Sending further probe messages into a congested path after a short interval, without backing off timers, could cause harm and result in a congestion collapse. Therefore it is essential to pick a large, conservative value for this interval.

3.3. Tree Diagram

This section provides a tree diagram [RFC8340] for the "ietf-tcp-common" module.
module: ietf-tcp-common

grouping tcp-common-grouping
  +-- keepalives! {keepalives-supported}?
    +-- idle-time    uint16
    +-- max-probes   uint16
    +-- probe-interval  uint16

grouping tcp-connection-grouping
  +-- keepalives! {keepalives-supported}?
    +-- idle-time    uint16
    +-- max-probes   uint16
    +-- probe-interval  uint16

3.4. Example Usage

This section presents an example showing the tcp-common-grouping populated with some data.

  <keepalives>
    <idle-time>15</idle-time>
    <max-probes>3</max-probes>
    <probe-interval>30</probe-interval>
  </keepalives>
</tcp-common>

3.5. YANG Module

The ietf-tcp-common YANG module references [RFC6991].

<CODE BEGINS> file "ietf-tcp-common@2019-10-18.yang"

module ietf-tcp-common {
  yang-version 1.1;
  prefix tcpcmn;

  organization
    "IETF NETCONF (Network Configuration) Working Group and the
     IETF TCP Maintenance and Minor Extensions (TCPM) Working Group";

  contact
    "WG Web:  <http://datatracker.ietf.org/wg/netconf/>
              <http://datatracker.ietf.org/wg/tcpm/>

6. Security Considerations

The YANG modules defined in this document are designed to be accessed via YANG based management protocols, such as NETCONF [RFC6241] and RESTCONF [RFC8040]. Both of these protocols have mandatory-to-
implement secure transport layers (e.g., SSH, TCP) with mutual authentication.

The NETCONF access control model (NACM) [RFC8341] provides the means to restrict access for particular users to a pre-configured subset of all available protocol operations and content.

Since the modules defined in this document only define groupings, these considerations are primarily for the designers of other modules that use these groupings.

There are a number of data nodes defined in the YANG modules that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

None of the writable/creatable/deletable data nodes in the YANG modules defined in this document are considered more sensitive or vulnerable than standard configuration.

Some of the readable data nodes in the YANG modules may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

None of the readable data nodes in the YANG modules defined in this document are considered more sensitive or vulnerable than standard configuration.

This document does not define any RPC actions and hence this section does not consider the security of RPCs.

7.  IANA Considerations

7.1.  The IETF XML Registry

This document registers two URIs in the "ns" subregistry of the IETF XML Registry [RFC3688]. Following the format in [RFC3688], the following registrations are requested:
7.2. The YANG Module Names Registry

This document registers two YANG modules in the YANG Module Names registry [RFC6020]. Following the format in [RFC6020], the following registrations are requested:

```
name:         ietf-tcp-common
prefix:       tcpcmn
reference:    RFC XXXX

name:         ietf-tcp-client
prefix:       tcpc
reference:    RFC XXXX

name:         ietf-tcp-server
prefix:       tcps
reference:    RFC XXXX
```

8. References

8.1. Normative References

8.2. Informative References

Appendix A. Change Log

A.1. 00 to 01

o Added ‘local-binding-supported’ feature to TCP-client model.

o Added ‘keepalives-supported’ feature to TCP-common model.

o Added ‘external-endpoint-values’ container and ‘external-endpoints’ feature to TCP-server model.

A.2. 01 to 02

o Removed the ‘external-endpoint-values’ container and ‘external-endpoints’ feature from the TCP-server model.

A.3. 02 to 03

o Moved the common model section to be before the client and server specific sections.

o Added sections "Model Scope" and "Usage Guidelines for Configuring TCP Keep- Alives" to the common model section.
