The application/pkix-attr-cert Media Type for Attribute Certificates
<draft-ietf-pkix-attr-cert-mime-type-03.txt>

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/1id-abstracts.html

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html

Abstract

This document specifies a MIME media type used to carry a single attribute certificate as defined in RFC 3281.
1. Introduction

RFC 2585 [RFC2585] defines the MIME media types for public key certificates and certificate revocation lists (CRLs). This document specifies a MIME media type for use with attribute certificates as defined in RFC 3281 [RFC3281].

Attribute certificates are ASN.1 encoded [X.680]. RFC 3281 [RFC3281] tells which portions of the attribute certificate must use the distinguished encoding rules (DER) [X.690] and which portions are permitted to use the basic encoding rules (BER) [X.690]. Since DER is a proper subset of BER, BER decoding all parts of a properly constructed attribute certificate will be successful.

2. IANA Considerations

This document registers with IANA the "application/pkix-attr-cert" Internet Media Type for use with an attribute certificate as defined in [RFC3281]. This registration follows the procedures defined in BCP 13 [RFC4288].

Type name: application

Subtype name: pkix-attr-cert

Required parameters: None

Optional parameters: None

Encoding considerations: binary

Security considerations:
An attribute certificate provides authorization information. An attribute certificate is most often used in conjunction with public key certificate [RFC5280], and the two certificates should use the same encoding of the distinguished name as described in the Security Considerations of this document.

Interoperability considerations:
The media type will be used with HTTP to fetch attribute certificates. Other uses may emerge in the future.

Published specification: RFC 3281

Applications which use this media type:
The media type is used with a MIME-compliant transport to transfer an attribute certificate. Attribute certificates convey authorization information, and they are most often used
in conjunction with public key certificates as defined in [RFC5280].

Additional information:
Magic number(s): None
File extension(s): .ac
Macintosh File Type Code(s): none

Intended usage: COMMON

Change controller:
The IESG <iesg@ietf.org>

3. Security Considerations

Attribute certificate issuers must encode the holder entity name in exactly the same way as the public key certificate distinguished name. If they are encoded differently, implementations may fail to recognize that the attribute certificate and public key certificate belong to the same entity.
