Abstract

This document defines a YANG RPC and a minimal datastore tree required to retrieve attestation evidence about integrity measurements from a composite device with one or more roots of trust for reporting. Complementary measurement logs are also provided by the YANG RPC originating from one or more roots of trust of measurement. The module defined requires at least one TPM 1.2 or TPM 2.0 and corresponding Trusted Software Stack included in the device components of the composite device the YANG server is running on.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on July 10, 2020.

1. Introduction

This document is based on the terminology defined in the [I-D.ietf-rats-architecture] and uses the interaction model and information elements defined in the [I-D.birkholz-rats-reference-interaction-model] document. The currently supported hardware security modules (HWM) - sometimes also referred to as an embedded secure element (eSE) - is the Trusted Platform Module (TPM) version 1.2 and 2.0 specified by the Trusted Computing Group (TCG). One or more TPMs embedded in the components of a composite device - sometimes also referred to as an aggregate device - are required in order to use the YANG module defined in this document. A TPM is used as a root of trust for reporting (RTR) in order to retrieve attestation evidence from a composite device (quote primitive operation). Additionally, it is used as a root of trust for storage (RTS) in order to retain shielded secrets and store
system measurements using a folding hash function (extent primitive operation).

1.1. Requirements notation

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

2. The YANG Module for Basic Remote Attestation Procedures

One or more TPM 2.0 MUST be embedded in the composite device that is providing attestation evidence via the YANG module defined in this document. The ietf-basic-remote-attestation YANG module enables a composite device to take on the role of Claimant and Attester in accordance with the Remote Attestation Procedures (RATS) architecture [I-D.ietf-rats-architecture] and the corresponding challenge-response interaction model defined in the [I-D.birkholz-rats-reference-interaction-model] document. A fresh nonce with an appropriate amount of entropy MUST be supplied by the YANG client in order to enable a proof-of-freshness with respect to the attestation evidence provided by the attester running the YANG datastore. The functions of this YANG module are restricted to 0-1 TPM 2.0 per hardware component.

3. IANA considerations

This document will include requests to IANA:

To be defined yet.

4. Security Considerations

There are always some.

5. Acknowledgements

Not yet.

6. Change Log

Changes from version 00 to version 01:

- Addressed author’s comments
- Extended complementary details about attestation-certificates
- Relabeled chunk-size to log-entry-quantity
- Relabeled location with compute-node or tpm-name where appropriate
- Added a valid entity-mib physical-index to compute-node and tpm-name to map it back to hardware inventory
- Relabeled name to tpm_name
- Removed event-string in last-entry
