Routing Area Common YANG Data Types
draft-ietf-rtgwg-routing-types-17

Abstract

This document defines a collection of common data types using the YANG data modeling language. These derived common types are designed to be imported by other modules defined in the routing area.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on April 16, 2018.

1. Introduction

The YANG [RFC6020] [RFC7950] is a data modeling language used to model configuration data, state data, Remote Procedure Calls, and notifications for network management protocols. The YANG language supports a small set of built-in data types and provides mechanisms to derive other types from the built-in types.

This document introduces a collection of common data types derived from the built-in YANG data types. The derived types are designed to be the common types applicable for modeling in the routing area.

2. Overview

This document defines the two models for common routing types, ietf-routing-types and iana-routing-types. The only module imports are from [RFC6991]. The ietf-routing-types model contains common routing types other than those corresponding directly to IANA mappings. These include:

router-id
Router Identifiers are commonly used to identify nodes in routing and other control plane protocols. An example usage of router-id can be found in [I-D.ietf-ospf-yang].

route-target
Route Targets (RTs) are commonly used to control the distribution of virtual routing and forwarding (VRF) information, see [RFC4364], in support of BGP/MPLS IP virtual private networks (VPNs) and BGP/MPLS Ethernet VPNs [RFC7432]. An example usage can be found in [I-D.ietf-bess-l2vpn-yang].

ipv6-route-target
IPv6 Route Targets (RTs) are similar to standard Route Targets only they are IPv6 Address Specific BGP Extended Communities as described in [RFC5701]. An IPv6 Route Target is 20 octets and includes an IPv6 address as the global administrator.

route-target-type
This type defines the import and export rules of Route Targets, as described in Section 4.3.1 of [RFC4364]. An example usage can be found in [I-D.ietf-idr-bgp-model].

route-distinguisher
Route Distinguishers (RDs) are commonly used to identify separate routes in support of virtual private networks (VPNs). For example, in [RFC4364], RDs are commonly used to identify independent VPNs and VRFs, and more generally, to identify multiple routes to the same prefix. An example usage can be found in [I-D.ietf-idr-bgp-model].

route-origin
Route Origin is commonly used to indicate the Site of Origin for Routing and forwarding (VRF) information, see [RFC4364], in support of BGP/MPLS IP virtual private networks (VPNs) and BGP/MPLS Ethernet VPNs [RFC7432]. An example usage can be found in [I-D.ietf-bess-l3vpn-yang].

ipv6-route-origin
An IPv6 Route Origin would also be used to indicate the Site of Origin for Routing and forwarding (VRF) information, see [RFC4364], in support of virtual private networks (VPNs). IPv6 Route Origins are IPv6 Address Specific BGP Extended Communities as described in [RFC5701]. An IPv6 Route Origin is 20 octets and includes an IPv6 address as the global administrator.

ipv4-multicast-group-address
This type defines the representation of an IPv4 multicast group address, which is in the range from 224.0.0.0 to 239.255.255.255. An example usage can be found in [I-D.ietf-pim-yang].

ipv6-multicast-group-address
This type defines the representation of an IPv6 multicast group address, which is in the range of FF00::/8. An example usage can be found in [I-D.ietf-pim-yang].

ip-multicast-group-address
This type represents an IP multicast group address and is IP version neutral. The format of the textual representation implies the IP version. An example usage can be found in [I-D.ietf-pim-yang].

ipv4-multicast-source-address
IPv4 source address type for use in multicast control protocols. This type also allows the indication of wildcard sources, i.e., ".*". An example of where this type may/will be used is [I-D.ietf-pim-yang].

ipv6-multicast-source-address
IPv6 source address type for use in multicast control protocols. This type also allows the indication of wildcard sources, i.e., ".*". An example of where this type may/will be used is [I-D.ietf-pim-yang].

bandwidth-ieee-float32
Bandwidth in IEEE 754 floating point 32-bit binary format [IEEE754]. Commonly used in Traffic Engineering control plane protocols. An example of where this type may/will be used is [I-D.ietf-ospf-yang].

link-access-type
This type identifies the IGP link type. An example of where this type may/will be used is [I-D.ietf-ospf-yang].

timer-multiplier
This type is used in conjunction with a timer-value type. It is generally used to indicate define the number of timer-value intervals that may expire before a specific event must occur. Examples of this include the arrival of any BFD packets, see [RFC5880] Section 6.8.4, or hello_interval in [RFC3209]. Example of where this type may/will be used is [I-D.ietf-idr-bgp-model] and [I-D.ietf-teas-yang-rsvp].

timer-value-seconds16
This type covers timers which can be set in seconds, not set, or set to infinity. This type supports a range of values that can be represented in a uint16 (2 octets). An example of where this type may/will be used is [I-D.ietf-ospf-yang].

timer-value-seconds32
This type covers timers which can be set in seconds, not set, or set to infinity. This type supports a range of values that can be represented in a uint32 (4 octets). An example of where this type may/will be used is [I-D.ietf-teas-yang-rsvp].

timer-value-milliseconds
This type covers timers which can be set in milliseconds, not set, or set to infinity. This type supports a range of values that can be represented in a uint32 (4 octets). Examples of where this type may/will be used include [I-D.ietf-teas-yang-rsvp] and [I-D.ietf-bfd-yang].

percentage
This type defines a percentage with a range of 0-100%. An example usage can be found in [I-D.ietf-idr-bgp-model].

timeticks64
This type is based on the timeticks type defined in [RFC6991] but with 64-bit precision. It represents the time in hundredths of a second between two epochs. An example usage can be found in [I-D.ietf-idr-bgp-model].

uint24
This type defines a 24-bit unsigned integer. It is used by [I-D.ietf-ospf-yang].

generalized-label
This type represents a generalized label for Generalized Multi-Protocol Label Switching (GMPLS) [RFC3471]. The Generalized Label does not identify its type, which is known from the context. An example usage can be found in [I-D.ietf-teas-yang-te].

mpls-label-special-purpose
This type represents the special-purpose Multiprotocol Label Switching (MPLS) label values [RFC7274]. An example usage can be found in [I-D.ietf-mpls-base-yang].

mpls-label-general-use
The 20 bits label values in an MPLS label stack entry, specified in [RFC3032]. This label value does not include the encodings of Traffic Class and TTL (time to live). The label range specified by this type is for general use, with special-purpose MPLS label
values excluded. An example usage can be found in [I-D.ietf-mpls-base-yang].

mpls-label
The 20 bits label values in an MPLS label stack entry, specified in [RFC3032]. This label value does not include the encodings of Traffic Class and TTL (time to live). The label range specified by this type covers the general use values and the special-purpose label values. An example usage can be found in [I-D.ietf-mpls-base-yang].

This document defines the following YANG groupings:

mpls-label-stack
This grouping defines a reusable collection of schema nodes representing an MPLS label stack [RFC3032]. An example usage can be found in [I-D.ietf-mpls-base-yang].

vpn-route-targets
This grouping defines a reusable collection of schema nodes representing Route Target import-export rules used in the BGP enabled Virtual Private Networks (VPNs). [RFC4364][RFC4664]. An example usage can be found in [I-D.ietf-bess-l2vpn-yang].

The iana-routing-types model contains common routing types corresponding directly to IANA mappings. These include:

address-family
This type defines values for use in address family identifiers. The values are based on the IANA Address Family Numbers Registry [IANA-ADDRESS-FAMILY-REGISTRY]. An example usage can be found in [I-D.ietf-idr-bgp-model].

subsequent-address-family
This type defines values for use in subsequent address family (SAFI) identifiers. The values are based on the IANA Subsequent Address Family Identifiers (SAFI) Parameters Registry [IANA-SAFI-REGISTRY].

/*** Collection of types related to routing ***/
typedef router-id {
    type yang:dotted-quad;
description
    "A 32-bit number in the dotted quad format assigned to each router. This number uniquely identifies the router within an Autonomous System."
}

/*** Collection of types related to VPN ***/
typedef route-target {
    type string {
        pattern
            '(0:(6553[0-5]|655[0-2] [0-9]|65[0-4][0-9])0-9){2}|' + '6[0-4][0-9]0-9}{3}|' + '[1-5][0-9]0-9}{4}|[1-9][0-9]0-9}{3}|0:(429496729[0-5]|' + '42949672[0-8][0-9]|' + '4294967[0-1][0-9]2)4294960-6[0-9]0-9{3}|' + '42949[0-5][0-9]0-9{4}|'
A route target is an 8-octet BGP extended community initially identifying a set of sites in a BGP VPN (RFC 4364). However, it has since taken on a more general role in BGP route filtering. A route target consists of two or three fields: a 2-octet type field, an administrator field, and, optionally, an assigned number field.

According to the data formats for type 0, 1, 2, and 6 defined in RFC4360, RFC5668, and RFC7432, the encoding pattern is defined as:

0:2-octet-asn:4-octet-number
1:4-octet-ipv4addr:2-octet-number
2:4-octet-asn:2-octet-number.
6:6-octet-mac-address.

Additionally, a generic pattern is defined for future route target types:

2-octet-other-hex-number:6-octet-hex-number

Some valid examples are: 0:100:100, 1:1.1.1.1.1:100, 2:1234567890:203 and 6:26:00:08:92:78:00";}
typedef ipv6-route-target {
  type string {
    pattern
    "((::1[0-9a-fA-F]{0,4}):(0,4):{0,5})
      + '(((0-9a-fA-F){0,4}):(0,4):{0,5})\{3\}
      + '{6553[0-5]6550-2[0-9]650-409}\{2\}
      + '{60-409}\{3\}
      + '{1-50-9041-909}\{0,3\}\{0\}
      pattern
      "(([^:]+:){6}(([^:]+:[^:]+)|(.*..))]]
      + '{([^:]+*:[^:]+)*?::(^[^:]+*:[^:]+)*？}
      + '{6553[0-5]6550-2[0-9]650-409}\{2\}
      + '{60-409}\{3\}
      + '{1-50-9041-909}\{0,3\}\{0\}
      }

}
"Bandwidth in IEEE 754 floating point 32-bit binary format:
(-1)**(S) * 2**(Exponent-127) * (1 + Fraction),
where Exponent uses 8 bits, and Fraction uses 23 bits.
The units are octets per second.
The encoding format is the external hexadecimal-significant
character sequences specified in IEEE 754 and C99. The
format is restricted to be normalized, non-negative, and
non-fraction: 0x1.hhhhhhp{+}d, 0X1.HHHHHHP{+}D, or 0x0p0,
where ‘h’ and ‘H’ are hexadecimal digits and ‘d’ and ‘D’ are
integers in the range of [0..127].
When six hexadecimal digits are used for ‘hhhhhh’ or
‘HHHHHH’, the least significant digit must be an even
number. ‘x’ and ‘X’ indicate hexadecimal; ‘p’ and ‘P’
indicate power of two. Some examples are: 0x0p0, 0x1p10, and
0x1.abcde2p+20";

5. IANA Considerations

RFC Ed.: In this section, replace all occurrences of 'XXXX' with the actual RFC number (and remove this note).

This document registers the following namespace URIs in the IETF XML registry [RFC3688]:

--------------------------------------------------------------------
Registrant Contact: The IESG.
XML: N/A, the requested URI is an XML namespace.
--------------------------------------------------------------------

--------------------------------------------------------------------
Registrant Contact: IANA
XML: N/A, the requested URI is an XML namespace.
--------------------------------------------------------------------
This document registers the following YANG modules in the YANG Module Names registry [RFC6020]:

```
name:         ietf-routing-types
prefix:       rt-types
reference:    RFC XXXX
```

```
name:         iana-routing-types
prefix:       iana-rt-types
reference:    RFC XXXX
```

5.1.  IANA-Maintained iana-routing-types Module

This document defines the initial version of the IANA-maintained iana-routing-types YANG module Section 4.

The iana-routing-types YANG module is intended to reflect the "Address Family Numbers" registry [IANA-ADDRESS-FAMILY-REGISTRY] and "Subsequent Address Family Identifiers (SAFI) Parameters" registry [IANA-SAFI-REGISTRY].

IANA has added this notes to the "iana-routing-types YANG Module" registry:

Address Families and Subsequent Address Families must not be directly added to the iana-routing-types YANG module. They must instead be respectively added to the "Address Family Numbers" and "Subsequent Address Family Identifiers (SAFI) Parameters" registries.

When an Address Family or Subsequent Address Family is respectively added to the "Address Family Numbers" registry or the "Subsequent Address Family Identifiers (SAFI) Parameters" registry, a new "enum" statement must be added to the iana-routing-types YANG module. The name of the "enum" is the same as the corresponding address family or SAFI only it will be a valid YANG identifier in all lowercase and with hyphens separating individual words in compound identifiers. The following substatements to the "enum" statement should be defined:
"enum": Contains the YANG enum identifier for the address-family or "bgp-safi" for subsequent address families. This may be the same as the address-family or "bgp-safi" or it may be a shorter version to facilitate YANG identifier usage.

"value": Contains the IANA assigned value corresponding to the address-family or "bgp-safi" for subsequent address families.

"status": Include only if a registration has been deprecated (use the value "deprecated") or obsoleted (use the value "obsolete").

"description": Replicate the description from the registry, if any. Insert line breaks as needed so that the line does not exceed 72 characters.

"reference": Replicate the reference from the registry, if any, and add the title of the document.

Unassigned or reserved values are not present in these modules.

When the iana-routing-types YANG module is updated, a new "revision" statement must be added in front of the existing revision statements.

IANA has added this new note to the "Address Family Numbers" and "Subsequent Address Family Identifiers (SAFI) Parameters" registries:

When this registry is modified, the YANG module iana-routing-types must be updated as defined in RFC XXXX.

6. Security Considerations

This document defines common routing type definitions (i.e., typedef statements) using the YANG data modeling language. The definitions themselves have no security or privacy impact on the Internet, but the usage of these definitions in concrete YANG modules might have. The security considerations spelled out in the YANG specification [RFC7950] apply for this document as well.
