Abstract

The System for Cross-Domain Identity Management (SCIM) specification is an HTTP based protocol that makes managing identities in multi-domain scenarios easier to support through a standardized service. Examples include but are not limited to enterprise to cloud service providers, and inter-cloud based scenarios. The specification suite seeks to build upon experience with existing schemas and deployments, placing specific emphasis on simplicity of development and integration, while applying existing authentication, authorization, and privacy models. SCIM’s intent is to reduce the cost and complexity of user management operations by providing a common user schema, an extension model, and a service protocol defined by this document.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on November 16, 2015.

1. Introduction and Overview

The SCIM Protocol is an application-level, HTTP protocol for provisioning and managing identity data on the web and in cross-domain environments such as enterprise to cloud, or inter-cloud scenarios. The protocol supports creation, modification, retrieval, and discovery of core identity resources such as Users and Groups, as well as custom resources and resource extensions.

The definition of resources, attributes, and overall schema are defined in the SCIM Core Schema document (see [I-D.ietf-scim-core-schema]). ([RFC Editor: These specifications should be published together])

1.1. Intended Audience

This document is intended as a guide to SCIM protocol usage for both SCIM HTTP service providers and HTTP clients who may provision information to service providers or retrieve information from them.
1.2. Notational Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119]. These keywords are capitalized when used to unambiguously specify requirements of the protocol or application features and behavior that affect the interoperability and security of implementations. When these words are not capitalized, they are meant in their natural-language sense.

For purposes of readability examples are not URL encoded. Implementers MUST percent encode URLs as described in Section 2.1 of [RFC3986].

Throughout this documents all figures may contain spaces and extra line-wrapping for readability and space limitations. Similarly, some URI’s contained within examples, have been shortened for space and readability reasons.

1.3. Definitions

This specification uses the definitions from [I-D.ietf-scim-core-schema], and defines the following additional terms:

Base URI

The SCIM HTTP protocol is described in terms of a path relative to a Base URI. The Base URI MUST NOT contain a query string as clients MAY append additional path information and query parameters as part of forming the request. The base URI most often is a URL which most often consists of the "https" protocol scheme, a domain name and some initial path [RFC3986]. Example: "https://example.com/scim/"

For readability, all examples in this document are expressed assuming the SCIM service root and the server root are the same (no path pre-fix). It is expected that SCIM servers may be deployed using any URI path prefix. For example, a SCIM server might be have a prefix of "https://example.com/", or "https://example.com/scim/tenancypath/". Additionally a client MAY also apply a version number to the server root prefix (see Section 3.13 ).
2. Authentication and Authorization

SCIM Protocol is based upon HTTP and does not itself define a SCIM specific scheme for authentication and authorization. SCIM depends on the use of TLS and/or standard HTTP authentication and authorization schemes as per [RFC7235]. For example, the following methodologies could be used among others:

TLS Client Authentication
The SCIM service provider MAY request TLS client authentication (also known as mutual authentication). See Section 7.3 [RFC5246].

HOBA Authentication
HTTP Origin-Bound Authentication (HOBA) is a variation on TLS client authentication and uses a digital-signature-based design for an HTTP authentication method (see [RFC7486]). The design can also be used in JavaScript-based authentication embedded in HTML. HOBA is an alternative to HTTP authentication schemes that require passwords and therefore avoids all problems related to passwords, such as leakage of server-side password databases.

Bearer Tokens
Bearer tokens [RFC6750] MAY be used when combined with TLS and a token framework such as OAuth 2.0 [RFC6749]. Tokens that are issued based on weak or no authentication of authorizing users and/or OAuth clients SHOULD NOT be used, unless for example, they are being used as single-use tokens to permit one-time requests such as anonymous registration (see Section 3.3). For security considerations regarding the use of bearer tokens in SCIM see Section 7.4. While bearer tokens most often represent an authorization, it is assumed that the authorization was based upon a successful authentication of the SCIM client. Accordingly the SCIM service provider must have a method for validating, parsing, and or introspecting the bearer token for the relevant authentication and authorization information. The method for this is assumed to be defined by the token issuing system and is beyond the scope of this specification.

POP Tokens
A proof-of-possession token demonstrates the presenter of the token possesses a particular key and that the recipient can cryptographically confirm proof-of-possession of the key by the presenter. This property is sometimes also described as the presenter being a holder-of-key. See OAuth 2.0 Proof-of- Possession Security Architecture [I-D.ietf-oauth-pop-architecture] for an example of such a token and its use.

Cookies
Javascript clients MAY assert HTTP cookies over TLS that contain an authentication state that is understood by the SCIM service provider (see [RFC6265]). An example of this is scenarios where web-form authentication has taken place with the user and HTTP cookies were set representing the authentication state. For the purposes of SCIM, the security considerations in Section 7.4 apply.

Basic Authentication

Usage of basic authentication should be avoided due to its use of a single factor that is based upon a relatively static, symmetric secret. Implementers SHOULD combine the use of basic authentication with other factors. The security considerations of HTTP BASIC, are well documented in [I-D.ietf-httpauth-basicauth-update], and therefore implementers are encouraged to prefer stronger authentication methods.

Designating the specific methods of authentication and authorization are out-of-scope for SCIM, however this information is provided as a resource to implementers.

As per Section 4.1 of [RFC7235], a SCIM service provider SHALL indicate supported HTTP authentication schemes via the "WWW-Authenticate" header.

Regardless of methodology, the SCIM service provider MUST be able to map the authenticated client to an access control policy in order to determine the client’s authorization to retrieve and update SCIM resources. For example, while a browser session may have been established via HTTP cookie or TLS client authentication, the unique client MUST be mapped to a security subject (e.g., User). The authorization model and the process by which this is done is beyond the scope of this specification.

When processing requests, the service provider SHOULD consider the subject performing the request and whether the action is appropriate given the subject and the resource affected by the request. The subject performing the request is usually determined directly or indirectly from the "Authorization" header present in the request. For example, a subject MAY be permitted to retrieve and update their own "User" resource, but will normally have restricted ability to access resources associated with other Users. In other cases, the SCIM service provider might only grant access to a subject’s own associated "User" resource (e.g., for the purpose of updating personal contact attributes).

For illustrative purposes only, SCIM protocol examples show an OAuth2 bearer token value [RFC6750] in the authorization header; e.g.,
GET /Users/2819c223-7f76-453a-919d-413861904646 HTTP/1.1
Host: example.com
Authorization: Bearer h480djs93hd8

This is not intended to imply that bearer tokens are preferred. However, the use of bearer tokens in the specification does reflect common implementation practice.

### 2.1. Use of Tokens as Authorizations

When using bearer tokens or proof-of-possession tokens that represent an authorization grant such as issued by OAuth (see [RFC6749]), implementers SHOULD consider the type of authorization granted, any authorized scopes (see Section 3.3 of [RFC6749]), and the security subject(s) that SHOULD be mapped from the authorization when considering local access control rules. Section 6 of the OAuth Assertions draft [I-D.ietf-oauth-assertions], documents common scenarios for authorization including:

- Clients using an assertion to authenticate and/or act on behalf of itself;
- Clients acting on behalf of a user; and,
- A Client acting on behalf of an anonymous user (e.g., see next section).

When using OAuth authorization tokens, implementers MUST take into account the threats and countermeasures documented in the security considerations for the use of client authorizations (see Section 8 of [I-D.ietf-oauth-assertions]). When using other token formats or frameworks, implementers MUST take into account similar threats and countermeasures, especially those documented by the relevant specifications.

### 2.2. Anonymous Requests

In some SCIM deployments it MAY be acceptable to permit unauthenticated (anonymous) requests. For example, a user self-registration request where the service provider chooses to accept a SCIM Create request (see Section 3.3) from an anonymous client. See Section 7.6, for security considerations regarding anonymous requests.
3. SCIM Protocol

3.1. Introduction

SCIM is a protocol that is based on HTTP protocol [RFC7230]. Along with HTTP headers and URIs, SCIM uses JSON [RFC7159] payloads to convey both SCIM resources, as well as protocol specific payload messages that convey request parameters and response information such as errors. Both resources and messages are passed in the form of JSON based structures in the message body of an HTTP request or response. To identify this content, SCIM uses a media type of "application/scim+json" (see Section 8.1).

A SCIM "resource" is a JSON object [RFC7159] that may be created, maintained, and retrieved through HTTP request methods as described in this document. Each JSON resource representation contains a "schemas" attribute that contains a list of one or more URIs that indicate included SCIM schemas that are used to indicate the attributes contained within a resource. Specific information about what attributes are defined within a schema MAY be obtained by querying a SCIM service provider’s "/Schemas" endpoint for a schema definition (see Section 8.7 [I-D.ietf-scim-core-schema]). Responses from this endpoint describe how a service provider supports a schema and in particular how attribute qualities such as cardinality, case-exactness, mutability, uniqueness, returnability, and whether an attribute is required. While SCIM schemas and associated extension model are defined in [I-D.ietf-scim-core-schema], SCIM clients should expect that some attribute schema may change from service provider to service provider, particularly across administrative domains. In cases where SCIM may be used as an open protocol in front of an application service, it is quite reasonable to expect that some service providers may only support a sub-set of the schema defined in [I-D.ietf-scim-core-schema].

A SCIM message conveys protocol parameters about a SCIM request or response that are defined by this specification. As with a SCIM resource, a SCIM message is a JSON object [RFC7159] that contains a "schemas" attribute with a URI whose namespace prefix that MUST begin with "urn:ietf:params:scim:api:"". As SCIM protocol messages are fixed and defined by SCIM specifications and registered extensions, SCIM message schemas using the above prefix URN SHALL NOT be discoverable using the "/Schemas" endpoint.

As SCIM is intended for use in cross-domain scenarios where schema and implementations may vary, techniques such as document validation, such as in [XML-Schema], are not recommended. A SCIM service provider interprets a request in the context of its own schema (which may be different from the client’s schema) and following the defined
processing rules for each request. The following sections in this document define the processing rules for SCIM and provide allowances for schema differences where appropriate. For example, in a SCIM PUT request, "readOnly" attributes are ignored, while "readWrite" attributes are updated. There is no need for a SCIM client to discover which attributes are "readOnly" and the client does not need to remove them from a PUT request in order to be accepted. Similarly a SCIM client SHOULD NOT expect a service provider to return SCIM resources with exactly the same schema and values as submitted. SCIM responses SHALL reflect resource state as interpreted by the SCIM service provider.

3.2. SCIM Endpoints and HTTP Methods

The SCIM protocol specifies well-known endpoints and HTTP methods for managing resources defined in the core schema; i.e., "User" and "Group" resources correspond to "/Users" and "/Groups" respectively. Service providers that support extended resources SHOULD define resource endpoints using the convention of pluralizing the resource name defined in the extended schema by appending an ‘s’. Given there are cases where resource pluralization is ambiguous; e.g., a resource named "Person" is legitimately "Persons" and "People", clients SHOULD discover resource endpoints via the "/ResourceTypes" endpoint.

<table>

<td>Search [prefix]/.search</td>
<td>POST (Section 3.4.3)</td>
<td>Search from system root or within a resource endpoint for one or more resource types using POST.</td>
</tr>
</tbody>
</table>

Table 2: Defined endpoints

All requests to the service provider are made via HTTP Methods as per Section 4.3 [RFC7231] on a URL derived from the Base URL. Responses are returned in the body of the HTTP response, formatted as JSON. Error status codes SHOULD be transmitted via the HTTP status code of the response (if possible), and SHOULD also be specified in the body of the response (see Section 3.12).

3.3. Creating Resources

To create new resources, clients send HTTP POST requests to the resource endpoint such as: "/Users" or "/Groups", as defined by the associated resource type endpoint discovery (see Section 4).
The server SHALL process attributes according to the following mutability rules:

- Attributes in the request body, whose mutability is "readOnly" (see Section 2.2 of [I-D.ietf-scim-core-schema]), SHALL be ignored.

- Attributes whose mutability is "readWrite" (see Section 2.2 of [I-D.ietf-scim-core-schema]), that are omitted from the request body, MAY be assumed to be not asserted by the client. The service provider MAY assign a default value to non-asserted attributes in the final resource representation.

- Service providers MAY take into account whether a client has access to all of the resource’s attributes when deciding whether non-asserted attributes should be defaulted.

- Clients that intend to override existing or server defaulted values for attributes MAY specify "null" for a single-valued attribute or an empty array "[]" for a multi-valued attribute to clear all values.

When the service provider successfully creates the new resource, an HTTP response SHALL be returned with HTTP status "201" ("Created"). The response body SHOULD contain the service provider’s representation of the newly created resource. The URI of the created resource SHALL included in the HTTP "Location" header and the HTTP body, a JSON representation [RFC7159] with the attribute "meta.location". Since the server is free to alter and/or ignore POSTed content, returning the full representation can be useful to the client, enabling it to correlate the client and server views of the new resource.

If the service provider determines creation of the requested resource conflicts with existing resources; e.g., a "User" resource with a duplicate "userName", the service provider MUST return an HTTP Status 409, with "scimType" error code of "uniqueness" as per Section 3.12.

In the following example, a client sends a POST request containing a "User" to the "/Users" endpoint.
POST /Users HTTP/1.1
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
Content-Length: ...

{
  "schemas": ["urn:ietf:params:scim:schemas:core:2.0:User"],
  "userName": "bjensen",
  "externalId": "bjensen",
  "name": {
    "formatted": "Ms. Barbara J Jensen III",
    "familyName": "Jensen",
    "givenName": "Barbara"
  }
}

In response to the example request above, the server signals a successful creation with an HTTP status code 201 (Created) and returns a representation of the resource created.

HTTP/1.1 201 Created
Content-Type: application/scim+json
Location: https://example.com/v2/Users/2819c223-7f76-453a-919d-413861904646
ETag: W/"e180ee84f0671b1"

{
  "schemas": ["urn:ietf:params:scim:schemas:core:2.0:User"],

    "resourceType": "User",
    "created": "2011-08-01T21:32:44.882Z",
    "lastModified": "2011-08-01T21:32:44.882Z",
    "location": "https://example.com/v2/Users/2819c223-7f76-453a-919d-413861904646",
    "version": "W/"e180ee84f0671b1""
  },
  "name": {
    "formatted": "Ms. Barbara J Jensen III",
    "familyName": "Jensen",
    "givenName": "Barbara"
  },
  "userName": "bjensen"
3.3.1. Resource Types

When adding a resource to a specific endpoint, the meta attribute "resourceType" SHALL be set by the HTTP service provider to the corresponding resource type for the endpoint. For example, a POST to the endpoint "/Users" will set "resourceType" to "User", and "/Groups" will set "resourceType" to "Group".

3.4. Retrieving Resources

Resources MAY be retrieved via opaque, unique URLs or via Query (see Section 3.4.2). The attributes returned are defined in the server’s attribute schema (see Section 8.7 [I-D.ietf-scim-core-schema]) and request parameters (see Section 3.9). By default, resource attributes returned in a response are those attributes whose characteristic "returned" setting is "always" or "default" (see Section 2.2 of [I-D.ietf-scim-core-schema]).

3.4.1. Retrieving a known Resource

To retrieve a known resource, clients send GET requests to the resource endpoint; e.g., "/Users/{id}" or "/Groups/{id}", or "/Schemas/{id}", where "{id}" is a resource identifier (for example the value of the "id" attribute).

If the resource exists the server responds with HTTP Status code 200 (OK) and includes the result in the body of the response.

The below example retrieves a single User via the "/Users" endpoint.

GET /Users/2819c223-7f76-453a-919d-413861904646
Host: example.com
Accept: application/scim+json
Authorization: Bearer h480djs93hd8

The server responds with:
HTTP/1.1 200 OK
Content-Type: application/scim+json
Location: https://example.com/v2/Users/2819c223-7f76-453a-919d-413861904646
ETag: W/"f250dd84f0671c3"

{
  "schemas": ["urn:ietf:params:scim:schemas:core:2.0:User"],
  "id": "2819c223-7f76-453a-919d-413861904646",
  "externalId": "bjensen",
  "meta": {
    "resourceType": "User",
    "created": "2011-08-01T18:29:49.793Z",
    "lastModified": "2011-08-01T18:29:49.793Z",
    "location": "https://example.com/v2/Users/2819c223-7f76-453a-919d-413861904646",
    "version": "W/"f250dd84f0671c3"
  },
  "name": {
    "formatted": "Ms. Barbara J Jensen III",
    "familyName": "Jensen",
    "givenName": "Barbara"
  },
  "userName": "bjensen",
  "phoneNumbers": [
    {
      "value": "555-555-8377",
      "type": "work"
    }
  ],
  "emails": [
    {
      "value": "bjensen@example.com",
      "type": "work"
    }
  ]
}

3.4.2. Query Resources

The SCIM protocol defines a standard set of query parameters that can be used to filter, sort, and paginate to return zero or more resources in a query response. Queries MAY be made against a single resource or a resource type endpoint (e.g., "/Users"), or the service provider Base URI. SCIM service providers MAY support additional query parameters not specified here and SHOULD ignore any query parameters they do not recognize instead of rejecting the query for versioning compatibility reasons.
Responses MUST be identified using the following URI:
"urn:ietf:params:scim:api:messages:2.0:ListResponse". The following
attributes are defined for responses:

- **totalResults** The total number of results returned by the list or
  query operation. The value may be larger than the number of
  resources returned such as when returning a single page (see
  Section 3.4.2.4) of results where multiple pages are available.
  REQUIRED.

- **Resources** A multi-valued list of complex objects containing the
  requested resources. This MAY be a subset of the full set of
  resources if pagination (Section 3.4.2.4) is requested. REQUIRED
  if "totalResults" is non-zero.

- **startIndex** The 1-based index of the first result in the current set
  of list results. REQUIRED when partial results returned due to
  pagination.

- **itemsPerPage** The number of resources returned in a list response
  page. REQUIRED when partial results returned due to pagination.

A query that does not return any matches SHALL return success (HTTP
Status 200) with "totalResults" set to a value of 0.

The example query below requests the userName for all Users:

GET /Users?attributes=userName
Host: example.com
Accept: application/scim+json
Authorization: Bearer h480djs93hd8
The following is an example response to the query above:

HTTP/1.1 200 OK
Content-Type: application/scim+json

{
   "schemas": ["urn:ietf:params:scim:api:messages:2.0:ListResponse"],
   "totalResults": 2,
   "Resources": [
      {
         "id": "2819c223-7f76-453a-919d-413861904646",
         "userName": "bjensen"
      },
      {
         "id": "c75ad752-64ae-4823-840d-ffa80929976c",
         "userName": "jsmith"
      }
   ]
}

Note that in the above example, "id" is returned because the "id" attribute has the "returned" characteristic of "always".

3.4.2.1. Query Endpoints

Queries MAY be performed against a SCIM resource object, a resource type endpoint, or a SCIM server root. For example:

"/Users/{id}"

"/Users"

"/Groups"

A query against a server root indicates that all resources within the server SHALL be included subject to filtering. A filter expression using "meta.resourceType" MAY be used to restrict results to one or more specific resource types (to exclude others). For example:

filter=(meta.resourceType eq User) or (meta.resourceType eq Group)

If a SCIM service provider determines that too many results would be returned (e.g., because a client queried a resource type endpoint or the server base URI), the server SHALL reject the request by returning an HTTP response with "status" 400 and json attribute "scimType" set to "tooMany" (see Table 9).
When processing query operations using endpoints that include more than one SCIM resource type (e.g., a query from the server root endpoint), filters MUST be processed as outlined in Section 3.4.2.2. For filtered attributes that are not part of a particular resource type, the service provider SHALL treat the attribute as if there is no attribute value. For example, a presence or equality filter for an undefined attribute evaluates as FALSE.

3.4.2.2. Filtering

Filtering is an OPTIONAL parameter for SCIM service providers. Clients MAY discover service provider filter capabilities by looking at the "filter" attribute of the "ServiceProviderConfig" (see Section 4). Clients MAY request a subset of resources by specifying the "filter" query parameter containing a filter expression. When specified only those resources matching the filter expression SHALL be returned. The expression language that is used with the filter parameter supports references to attributes and literals.

Attribute names and attribute operators used in filters are case insensitive. For example, the following two expressions will evaluate to the same logical value:

\[
\text{filter=userName} \text{ Eq } \text{"john"}
\]

\[
\text{filter=Username} \text{ eq } \text{"john"}
\]

The filter parameter MUST contain at least one valid expression (see Table 3). Each expression MUST contain an attribute name followed by an attribute operator and optional value. Multiple expressions MAY be combined using a logical operators (see Table 4). Expressions MAY be grouped together using brackets "(" and ")" (see Table 5).

The operators supported in the expression are listed in the following table.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>eq</td>
<td>equal</td>

<td>The entire operator value must be a substring of the attribute value for a match.</td>
</tr>
<tr>
<td>sw</td>
<td>starts with</td>
<td>The entire operator value must be a substring of the attribute value,</td>
</tr>
</tbody>
</table>
starting at the beginning of the attribute value. This criterion is satisfied if the two strings are identical.

The entire operator value must be a substring of the attribute value, matching at the end of the attribute value. This criterion is satisfied if the two strings are identical.

If the attribute has a non-empty or non-null value, or if it contains a non-empty node for complex attributes there is a match.

If the attribute value is greater than operator value, there is a match. The actual comparison is dependent on the attribute type. For string attribute types, this is a lexicographical comparison and for DateTime types, it is a chronological comparison. For Integer attributes it is a comparison by numeric value. Boolean and Binary attributes SHALL cause a failed response (HTTP Status 400) with scimType of invalidFilter.

If the attribute value is greater than or equal to the operator value, there is a match. The actual comparison is dependent on the attribute type. For string attribute types, this is a lexicographical comparison and for DateTime types, it is a chronological comparison. For Integer attributes it is a comparison by numeric value. Boolean and Binary attributes SHALL cause a failed response (HTTP Status 400) with scimType of invalidFilter.

If the attribute value is less than operator value, there is a match. The actual comparison is dependent on the attribute type. For string attribute types, this is a lexicographical comparison and for DateTime types, it is a chronological comparison. For Integer attributes it is a comparison by numeric value. Boolean and Binary attributes SHALL cause a failed response (HTTP Status 400) with scimType of invalidFilter.
le  less than or equal  invalidFilter.

</table>

Table 4: Logical Operators
<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>( )</td>
<td>Precedence grouping</td>
<td>Boolean expressions MAY be grouped using parentheses to change the standard order of operations; i.e., evaluate &quot;or&quot; logical operators before logical &quot;and&quot; operators.</td>
</tr>
<tr>
<td>[ ]</td>
<td>Complex attribute filter grouping</td>
<td>Service providers MAY support complex filters where expressions MUST be applied to the same value of a parent attribute specified immediately before the left square bracket (&quot;[&quot;). The expression within square brackets (&quot;[&quot; and &quot;]&quot;) MUST be a valid filter expression based upon sub-attributes of the parent attribute. Nested expressions MAY be used. See examples below.</td>
</tr>
</tbody>
</table>

Table 5: Grouping Operators
SCIM filters MUST conform to the following ABNF [RFC5234] rules as specified below:

```
FILTER    = attrExp / logExp / valuePath / *1"not" "{" FILTER "}"
valuePath = attrPath "[" valFilter "]"
           ; FILTER uses sub-attribs of a parent attrPath
valFilter = attrExp / logExp / *1"not" "{" valFilter "}"
attrExp   = (attrPath SP "pr") /
           (attrPath SP compareOp SP compValue)
logExp    = FILTER SP ("and" / "or") SP FILTER
compValue = false / null / true / number / string
           ; rules from JSON (RFC7159)
compareOp = "eq" / "ne" / "co" / "sw" / "ew" /
           "gt" / "lt" /
           "ge" / "le"
attrPath  = [URI ":"] ATTRNAME *1subAttr
           ; SCIM attribute name
           ; URI is SCIM "schema" URI
ATTRNAME  = ALPHA *(nameChar)
nameChar  = "-" / "_" / DIGIT / ALPHA
subAttr   = "." ATTRNAME
           ; a sub-attribute of a complex attribute
```

Figure 1: ABNF Specification of SCIM Filters

In the above ABNF rules, the "compValue" (comparison value) rule is built on JSON Data Interchange format ABNF rules as specified in [RFC7159], "DIGIT" and "ALPHA" are defined per Appendix B.1 of [RFC5234] and, "URI" is defined per Appendix A of [RFC3986].

Filters MUST be evaluated using the following order of operations in order of precedence:

1. Grouping Operators

2. Logical Operators. Where "not" takes precedence over "and", which takes precedence over "or".

3. Attribute Operators

If the specified attribute in a filter expression is a multi-valued attribute, the filter matches if any of the values of the specified attribute match the specified criterion; e.g., if a User has multiple emails values, only one has to match for the entire User to match. For complex attributes, a fully qualified Sub-Attribute MUST be specified using standard attribute notation (Section 3.10). For example, to filter by userName the parameter value is "userName". To filter by first name, the parameter value is "name.givenName".

When applying a comparison (e.g., "eq") or presence filter (e.g., "pr"), to a defaulted attribute the service provider SHALL use the value that was returned to the client that last created or modified the attribute.

Providers MAY support additional filter operations if they choose. Providers MUST decline to filter results if the specified filter operation is not recognized and return a HTTP 400 error with a scim error type of "invalidFilter" and an appropriate human readable response as per Section 3.12. For example, if a client specified an unsupported operator named 'regex' the service provider should specify an error response description identifying the client error; e.g., 'The operator 'regex' is not supported.'

When comparing attributes of type String, the case sensitivity for String type attributes SHALL be determined by the attribute’s "caseExact" characteristic (see Section 2.2 [I-D.ietf-scim-core-schema]).

Clients MAY query by schema or schema extensions by using a filter expression including the "schemas" attribute (as shown in the following figure).
The following are examples of valid filters. Some attributes (e.g., rooms and rooms.number) are hypothetical extensions and are not part of SCIM core schema:

```
filter=userName eq "bjensen"
filter=name.familyName co "O'Malley"
filter=userName sw "J"
filter=userName sw "J"
filter=title pr
filter=meta.lastModified gt "2011-05-13T04:42:34Z"
filter=meta.lastModified ge "2011-05-13T04:42:34Z"
filter=meta.lastModified lt "2011-05-13T04:42:34Z"
filter=meta.lastModified le "2011-05-13T04:42:34Z"
filter=title pr and userType eq "Employee"
filter=title pr or userType eq "Intern"
filter=
filter=userType eq "Employee" and (emails co "example.com" or emails co "example.org")
filter=userType ne "Employee" and not (emails co "example.com" or emails co "example.org")
filter=userType eq "Employee" and (emails.type eq "work")
filter=userType eq "Employee" and emails[type eq "work" and value co "@example.com"]
filter=emails[type eq "work" and value co "@example.com"] or
    imss[type eq "xmpp" and value co "@foo.com"]
```

Figure 2: Example Filters
3.4.2.3. Sorting

Sort is OPTIONAL. Clients MAY discover sort capability by looking at the "sort" attribute of the service provider configuration (see Section 4). Sorting allows clients to specify the order in which resources are returned by specifying a combination of sortBy and sortOrder URL parameters.

sortBy  The sortBy parameter specifies the attribute whose value SHALL be used to order the returned responses. If the sortBy attribute corresponds to a singular attribute, resources are sorted according to that attribute’s value; if it’s a multi-valued attribute, resources are sorted by the value of the primary attribute (see Section 2.4 [I-D.ietf-scim-core-schema]), if any, or else the first value in the list, if any. If the attribute is complex the attribute name must be a path to a sub-attribute in standard attribute notation (Section 3.10); e.g., "sortBy=name.givenName". For all attribute types, if there is no data for the specified "sortBy" value they are sorted via the "sortOrder" parameter; i.e., they are ordered last if ascending and first if descending.

sortOrder  The order in which the sortBy parameter is applied. Allowed values are "ascending" and "descending". If a value for sortBy is provided and no sortOrder is specified, the sortOrder SHALL default to ascending. String type attributes are case insensitive by default unless the attribute type is defined as a case exact string. "sortOrder" MUST sort according to the attribute type; i.e., for case insensitive attributes, sort the result using case insensitive, Unicode alphabetic sort order, with no specific locale implied and for case exact attribute types, sort the result using case sensitive, Unicode alphabetic sort order.

3.4.2.4. Pagination

Pagination parameters can be used together to "page through" large numbers of resources so as not to overwhelm the client or service provider. Because pagination is not stateful, clients MUST be prepared to handle inconsistent results. For example, a request for a list of 10 resources beginning with a startIndex of 1 MAY return different results when repeated as a resource in the original result could be deleted or new ones could be added in-between requests. Pagination parameters and general behavior are derived from the OpenSearch Protocol [OpenSearch].

The following table describes the URL pagination parameters.
### Table 6: Pagination Request parameters

The following table describes the query response pagination attributes specified by the service provider.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startIndex</td>
<td>The 1-based index of the first query result. A value less than 1 SHALL be interpreted as 1.</td>
</tr>
<tr>
<td>count</td>
<td>Non-negative Integer. Specifies the desired maximum number of query results per page; e.g., 10. A negative value SHALL be interpreted as &quot;0&quot;. A value of &quot;0&quot; indicates no resource results are to be returned except for &quot;totalResults&quot;.</td>
</tr>
</tbody>
</table>

### Table 7: Pagination Response Elements

For example, to retrieve the first 10 Users, set the startIndex to 1 and the count to 10:

```
GET /Users?startIndex=1&count=10
Host: example.com
Accept: application/scim+json
Authorization: Bearer h480djs93hd8
```
The response to the query above returns metadata regarding paging similar to the following example (actual resources removed for brevity):

```
{
  "totalResults":100,
  "itemsPerPage":10,
  "startIndex":1,
  "schemas": ["urn:ietf:params:scim:api:messages:2.0:ListResponse"],
  "Resources": [{
    ...
  }]
}
```

Figure 3: ListResponse format for returning multiple resources

Given the example above, to continue paging set the startIndex to 11 and re-fetch; i.e., /Users?startIndex=11&count=10

3.4.2.5. Attributes

The following attributes control which attributes SHALL be returned with a returned resource. SCIM clients MAY use up to one of these two OPTIONAL parameters which MUST be supported by SCIM service providers:

attributes A multi-valued list of strings indicating the names of resource attributes to return in the response overriding the set of attributes that would be returned by default. Attribute names MUST be in standard.attribute notation (Section 3.10) form. See additional retrieval query parameters (Section 3.9).

excludedAttributes A multi-valued list of strings indicating the names of resource attributes to be removed from the default set of attributes to return. This parameter SHALL have no effect on attributes whose schema "returned" setting is "always" see Server Schema [I-D.ietf-scim-core-schema]. Attribute names MUST be in standard attribute notation (Section 3.10) form. See additional retrieval query parameters (Section 3.9).

3.4.3. Querying Resources Using HTTP POST

Clients MAY execute queries without passing parameters on the URL by using the HTTP POST verb combined with the "/.search" path extension. The inclusion of "/.search" on the end of a valid SCIM endpoint SHALL be used to indicate the HTTP POST verb is intended to be a query operation.
To create a new query result set, a SCIM client sends an HTTP POST request to the desired SCIM resource endpoint (ending in "/.search"). The body of the POST request MAY include any of the parameters as defined in Section 3.4.2.

Query requests MUST be identified using the following URI: "urn:ietf:params:scim:api:messages:2.0:SearchRequest". The following attributes are defined for query requests:

- **attributes** A multi-valued list of strings indicating the names of resource attributes to return in the response overriding the set of attributes that would be returned by default. Attribute names MUST be in standard attribute notation (Section 3.10) form. See additional retrieval query parameters (Section 3.9). OPTIONAL.

- **excludedAttributes** A multi-valued list of strings indicating the names of resource attributes to be removed from the default set of attributes to return. This parameter SHALL have no effect on attributes whose schema "returned" setting is "always" see Server Schema [I-D.ietf-scim-core-schema]. Attribute names MUST be in standard attribute notation (Section 3.10) form. See additional retrieval query parameters (Section 3.9). OPTIONAL.

- **filter** The filter string used to request a subset of resources. The filter string MUST be a valid filter (Section 3.4.2.2) expression. OPTIONAL.

- **sortBy** A string indicating the attribute whose value SHALL be used to order the returned responses. The sortBy attribute MUST be in standard attribute notation (Section 3.10) form. See sorting (Section 3.4.2.3). OPTIONAL.

- **sortOrder** A string indicating the order in which the sortBy parameter is applied. Allowed values are "ascending" and "descending". See sorting (Section 3.4.2.3). OPTIONAL.

- **startIndex** An integer indicating the 1-based index of the first query result. See pagination (Section 3.4.2.4). OPTIONAL.

- **count** An integer indicating the desired maximum number of query results per page. See pagination (Section 3.4.2.4). OPTIONAL.

After receiving a HTTP POST request, a response is returned as specified in Section 3.4.2.
The following example shows an HTTP POST Query request with search parameters attributes, filter, and count included:

POST /.search
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
Content-Length: ...

```
{
  "schemas": ["urn:ietf:params:scim:api:messages:2.0:SearchRequest"],
  "attributes": ["displayName", "userName"],
  "filter":
    "displayName sw "smith"",
  "startIndex": 1,
  "count": 10
}
```

Figure 4: Example POST Query Request

A query response is shown with the first page of results. For brevity reasons, only two matches are shown: one User and one Group.

HTTP/1.1 200 OK
Content-Type: application/scim+json
Location: https://example.com/.search

```
{
  "schemas": ["urn:ietf:params:scim:api:messages:2.0:ListResponse"],
  "totalResults":100,
  "itemsPerPage":10,
  "startIndex":1,
  "Resources":[
    {
      "id":"2819c223-7f76-413861904646",
      "userName":"jsmith",
      "displayName":"Smith, James"
    },
    {
      "id":"c8596b90-7539-4f20968d1908",
      "displayName":"Smith Family"
    },
    ...
  ]
}
```

Figure 5: Example POST Query Response
3.5. Modifying Resources

Resources can be modified in whole or in part using HTTP "PUT" or "PATCH", respectively. Implementers MUST support "PUT" as specified in Section 4.3 [RFC7231]. Resources such as Groups may be very large hence implementers SHOULD support HTTP PATCH [RFC5789] to enable partial resource modifications. Service provider support for HTTP "PATCH" may be discovered by querying the service provider configuration (see Section 4).

3.5.1. Replacing with PUT

HTTP PUT is used to replace a resource’s attributes. For example, clients that have previously retrieved the entire resource in advance and revised it, MAY replace the resource using an HTTP PUT. Because SCIM resource identifiers are assigned by the service provider, HTTP PUT MUST NOT be used to create new resources.

As the operation intent is to replace all attributes, SCIM clients MAY send all attributes regardless of each attribute’s mutability. The server will apply attribute by attribute replace according to the following attribute mutability rules:

**readWrite, writeOnly** Any values provided SHALL replace the existing attribute values.

Attributes whose mutability is "readWrite", that are omitted from the request body, MAY be assumed to be not asserted by the client. The service provider MAY assume any existing values are to be cleared or the service provider MAY assign a default value to the final resource representation. Service providers MAY take into account whether a client has access to, or understands, all of the resource’s attributes when deciding whether non-asserted attributes SHALL be removed or defaulted. Clients that want to override a server’s defaults MAY specify "null" for a single-valued attribute, or an empty array "[]" for a multi-valued attribute to clear all values.

**immutable** If value(s) are already set for the attribute, the input value(s) MUST match or HTTP status 400 SHOULD be returned with "scimType" error code "mutability". If the service provider has no existing values, the new value(s) SHALL be applied.

**readOnly** Any values provided SHALL be ignored.

If an attribute is "required", clients MUST specify the attribute in the PUT request.
Unless otherwise specified, a successful PUT operation returns a 200 OK response code and the entire resource within the response body, enabling the client to correlate the client’s and the service provider’s views of the updated resource. Example:

PUT /Users/2819c223-7f76-453a-919d-413861904646
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
If-Match: W/a330bc54f0671c9

{
    "schemas": ["urn:ietf:params:scim:schemas:core:2.0:User"],
    "id": "2819c223-7f76-453a-919d-413861904646",
    "userName": "bjensen",
    "externalId": "bjensen",
    "name": {
        "formatted": "Ms. Barbara J Jensen III",
        "familyName": "Jensen",
        "givenName": "Barbara",
        "middleName": "Jane"
    },
    "roles": [],
    "emails": [
        { "value": "bjensen@example.com" },
        { "value": "babs@jensen.org" }
    ]
}
The service responds with the entire, updated User:

HTTP/1.1 200 OK
Content-Type: application/scim+json
ETag: W/"b431af54f0671a2"
Location:
  "https://example.com/v2/Users/2819c223-7f76-453a-919d-413861904646"
{  
  "schemas": ["urn:ietf:params:scim:schemas:core:2.0:User"],
  "id": "2819c223-7f76-453a-919d-413861904646",
  "userName": "bjensen",
  "externalId": "bjensen",
  "name": {
    "formatted": "Ms. Barbara J Jensen III",
    "familyName": "Jensen",
    "givenName": "Barbara",
    "middleName": "Jane"
  },
  "emails": [
    {
      "value": "bjensen@example.com"
    },
    {
      "value": "babs@jensen.org"
    }
  ],
  "meta": {
    "resourceType": "User",
    "created": "2011-08-08T04:56:22Z",
    "lastModified": "2011-08-08T08:00:12Z",
    "location": "https://example.com/v2/Users/2819c223-7f76-453a-919d-413861904646",
    "version": "W/"b431af54f0671a2"
  }
}

3.5.2. Modifying with PATCH

HTTP PATCH is an OPTIONAL server function that enables clients to update one or more attributes of a SCIM resource using a sequence of operations to "add", "remove", or "replace" values. Clients may discover service provider support for PATCH by querying the service provider configuration (see Section 4).

The general form of the SCIM patch request is based on JavaScript Object Notation (JSON) Patch [RFC6902]. One difference between SCIM patch and JSON patch is that SCIM servers do not support array
indexing and do not support [RFC6902] operation types relating to
array element manipulation such as "move".

The body of each request MUST contain the "schemas" attribute with
the URI value of: "urn:ietf:params:scim:api:messages:2.0:PatchOp".

The body of an HTTP PATCH request MUST contain the attribute
"Operations", whose value is an array of one or more patch
operations. Each patch operation object MUST have exactly one "op"
member, whose value indicates the operation to perform and MAY be one
of "add", "remove", or "replace". The semantics of each operation
are defined in the following sub-sections.

The following is an example representation of a PATCH request showing
the basic JSON structure (non-normative):

```json
{
    "schemas": [
        "urn:ietf:params:scim:api:messages:2.0:PatchOp"
    ],
    "Operations": [
        {
            "op": "add",
            "path": "members",
            "value": [
                {
                    "display": "Babs Jensen",
                    "$ref": "https://example.com/v2/Users/2819c223...413861904646",
                    "value": "2819c223-7f76-453a-919d-413861904646"
                }
            ],
            ...
        ]
    }
}
```

Figure 6: Example JSON body for SCIM PATCH Request

The "path" attribute value is a String containing an attribute path
describing the target of the operation. The "path" attribute is
OPTIONAL for "add" and "replace" and is REQUIRED for "remove"
operations. See relevant operation sections below for details.

The "path" attribute is described by the following ABNF syntax rule:

```
PATH = attrPath / valuePath [subAttr]
```

Figure 7: SCIM Patch PATH Rule
The ABNF rules, "attrPath", "valuePath", and "subAttr" are defined in Section 3.4.2.2. The "valuePath" rule allows specific values of a complex, multi-valued attribute to be selected.

Valid examples of "path" are as follows:

- "path":"members"
- "path":"name.familyName"
- "path":"addresses[type eq \"work\"]"
- "path":"members[value eq \"2819c223-7f76-453a-919d-413861904646\"]"
- "path":"members[value eq \"2819c223-7f76-453a-919d-413861904646\]].displayName"

Figure 8: Example Path Values

Each operation against an attribute MUST be compatible with the attribute’s mutability and schema as defined in the Section 2.2 and 2.3 of [I-D.ietf-scim-core-schema]. For example, a client MUST NOT modify an attribute that has mutability "readOnly" or "immutable". However, a client MAY "add" a value to an "immutable" attribute if the attribute had no previous value. An operation that is not compatible with an attribute’s mutability or schema SHALL return the appropriate HTTP response status code and a JSON detail error response as defined in Section 3.12.

The attribute notation rules described in Section 3.10 apply for describing attribute paths. For all operations, the value of the "schemas" attribute on the SCIM service provider’s representation of the resource SHALL be assumed by default. If one of the PATCH operations modifies the "schemas" attribute, subsequent operations SHALL assume the modified state of the "schemas" attribute. Clients MAY implicitly modify the "schemas" attribute by adding (or replacing) an attribute with its fully qualified name including schema URN. For example, adding the attribute "urn:ietf:params:scim:schemas:extension:enterprise:2.0:User:employeeNumber", automatically adds the value "urn:ietf:params:scim:schemas:extension:enterprise:2.0:User" to the resource’s "schemas" attribute.

Each patch operation represents a single action to be applied to the same SCIM resource specified by the request URI. Operations are applied sequentially in the order they appear in the array. Each operation in the sequence is applied to the target resource; the
The resulting resource becomes the target of the next operation. Evaluation continues until all operations are successfully applied or until an error condition is encountered.

For multi-valued attributes, a patch operation that sets a value’s "primary" sub-attribute to "true", SHALL cause the server to automatically set "primary" to "false" for any other values in the array.

A patch request, regardless of the number of operations, SHALL be treated as atomic. If a single operation encounters an error condition, the original SCIM resource MUST be restored, and a failure status SHALL be returned.

If a request fails, the server SHALL return an HTTP response status code and a JSON detail error response as defined in Section 3.12.

On successful completion, the server MUST return either a 200 OK response code and the entire resource within the response body, subject to the "attributes" query parameter (see Additional Retrieval Query Parameters (Section 3.9)); or the server MAY return a 204 No Content response code and the appropriate response headers for a successful patch request. The server MUST return a 200 OK if the "attributes" parameter is specified on the request.

### 3.5.2.1. Add Operation

The "add" operation is used to add a new attribute value to an existing resource.

The operation MUST contain a "value" member whose content specifies the value to be added. The value MAY be a quoted value or it may be a JSON object containing the sub-attributes of the complex attribute specified in the operation’s "path".

The result of the add operation depends upon what the target location indicated by "path" references:

- If omitted, the target location is assumed to be the resource itself. The "value" parameter contains a set of attributes to be added to the resource.
- If the target location does not exist, the attribute and value is added.
- If the target location specifies a complex attribute, a set of sub-attributes SHALL be specified in the "value" parameter.
o If the target location specifies a multi-valued attribute, a new value is added to the attribute.

o if the target location specifies a single-valued attribute, the existing value is replaced.

o If the target location specifies an attribute that does not exist (has no value), the attribute is added with the new value.

o If the target location exists, the value is replaced.

o If the target location already contains the value specified, no changes SHOULD be made to the resource and a success response SHOULD be returned. Unless other operations change the resource, this operation SHALL NOT change the modify timestamp of the resource.

The following example shows how to add a member to a group. Some text removed for readability ("..."):

PATCH /Groups/acbf3ae7-8463-...-9b4da3f908ce
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
If-Match: W/"a330bc54f0671c9"

{ "schemas":
["urn:ietf:params:scim:api:messages:2.0:PatchOp"],
"Operations":
[
{ "op":"add",
 "path":"members",
 "value":[
 { "display": "Babs Jensen",
 "$ref": "https://example.com/v2/Users/2819c223...413861904646",
 "value": "2819c223-7f76-453a-919d-413861904646" }
 ]
 ]
}

If the user was already a member of this group, no changes should be made to the resource and a success response should be returned. The server responds with either the entire updated Group or no response body:
The following example shows how to add one or more attributes to a User resource without using a "path" attribute.

PATCH /Users/2819c223-7f76-453a-919d-413861904646
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
If-Match: W/"a330bc54f0671c9"

{
  "schemas":
   "Operations": [{
     "op": "add",
     "value": {
       "emails": [
         {
           "value": "babs@jensen.org",
           "type": "home"
         }
       ],
       "nickname": "Babs"
     }
   }]
}

In the above example, an additional value is added to the multi-valued attribute "emails". The second attribute, "nickname" is added to the User resource. If the resource already had an existing "nickname", the value is replaced per the processing rules above for single-valued attributes.

3.5.2.2. Remove Operation

The "remove" operation removes the value at the target location specified by the required attribute "path". The operation performs the following functions depending on the target location specified by "path":

- If "path" is unspecified, the operation fails with HTTP status "400" and "scimType" of "noTarget".
o If the target location is a single-value attribute, the attribute and its associated value is removed and the attribute SHALL be considered unassigned.

o If the target location is a multi-valued attribute and no filter is specified, the attribute and all values are removed and the attribute SHALL be considered unassigned.

o If the target location is a multi-valued attribute and a complex filter is specified comparing a "value", the values matched by the filter are removed. If after removal of the selected values, no other values remain, the multi-valued attribute SHALL be considered unassigned.

o If the target location is a complex-multi-valued attribute and a complex filter is specified based on the attribute’s sub-attributes, the matching records are removed. Sub-attributes whose values have been removed SHALL be considered unassigned. If the complex-multi-valued attribute has no remaining records, the attribute SHALL be considered unassigned.

If an attribute is removed or becomes unassigned and is defined as a required attribute or a read-only attribute, the server SHALL return an HTTP response status code and a JSON detail error response as defined in Section 3.12 with a "scimType" error of "mutability".

The following example shows how to remove a member from a group. As with the previous example, the "display" sub-attribute is optional. If the user was not a member of this group, no changes should be made to the resource and a success response should be returned.

Note that server responses have been omitted for the rest of the PATCH examples.
Remove a single member from a group. Some text removed for readability ("..."):

PATCH /Groups/acbf3ae7-8463-...-9b4da3f908ce
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
If-Match: W/"a330bc54f0671c9"

{
  "schemas": ["urn:ietf:params:scim:api:messages:2.0:PatchOp"],
  "Operations": [{
    "op": "remove",
    "path": "members[value eq \"2819c223-7f76-...413861904646\"]"
  }]
}

Remove all members of a group:

PATCH /Groups/acbf3ae7-8463-...-9b4da3f908ce
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
If-Match: W/"a330bc54f0671c9"

{
  "schemas": ["urn:ietf:params:scim:api:messages:2.0:PatchOp"],
  "Operations": [{
    "op": "remove",
    "path": "members"
  }]
}

Removal of a value from a complex-multi-valued attribute (request headers removed for brevity):

{
  "schemas": ["urn:ietf:params:scim:api:messages:2.0:PatchOp"],
  "Operations": [{
    "op": "remove",
    "path": "emails[type eq \"work\" and value eq \"example.com\"]"
  }]
}
Example request to remove and add a member. Some text removed for readability ("..."):

}
]
}]}
The following example shows how to replace all the members of a group with a different members list. Some text removed for readability ("..."):

PATCH /Groups/acbf3ae7-8463-4692-b4fd-9b4da3f908ce
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
If-Match: W/"a330bc54f0671c9"
{
  "schemas": [
    "urn:ietf:params:scim:api:messages:2.0:PatchOp"
  ],
  "Operations": [
    {
      "op": "remove",
      "path": "members"
    },
    {
      "op": "add",
      "path": "members",
      "value": [
        {
          "display": "Babs Jensen",
          "$ref": "https://example.com/v2/Users/2819c223...413861904646",
          "value": "2819c223-7f76-453a-919d-413861904646"
        },
        {
          "display": "James Smith",
          "$ref": "https://example.com/v2/Users/08e1d05d...473d93df9210",
          "value": "08e1d05d-121c-4561-8b96-473d93df9210"
        }
      ]
    }
  ]
}

3.5.2.3. Replace Operation

The "replace" operation replaces the value at the target location specified by the "path". The operation performs the following functions depending on the target location specified by "path":

- If the "path" parameter is omitted, the target is assumed to be the resource itself. In this case, the "value" attribute SHALL contain a list of one or more attributes that are to be replaced.
- If the target location is a single-value attribute, the attribute's value is replaced.

- If the target location is a multi-valued attribute and no filter is specified, the attribute and all values are replaced.

- If the target location path specifies an attribute that does not exist, the service provider SHALL treat the operation as an "add".

- If the target location specifies a complex attribute, a set of sub-attributes SHALL be specified in the "value" parameter which replaces any existing values or adds where an attribute did not previously exist. Sub-attributes that are not specified in the "value" parameter are left unchanged.

- If the target location is a multi-valued attribute and a value selection ("valuePath") filter is specified that matches one or more values of the multi-valued attribute, then all matching record values SHALL be replaced.

- If the target location is a complex-multi-valued attribute with a value selection filter ("valuePath") and a specific sub-attribute (e.g., "addresses[type eq "work"].streetAddress"), the matching sub-attribute of all matching records is replaced.

- If the target location is a multi-valued attribute for which a value selection filter ("valuePath") has been supplied and no record match was made, the service provider SHALL fail by returning HTTP status "400", and a "scimType" of "noTarget".
The following example shows how to replace all the members of a group with a different members list in a single replace operation. Some text removed for readability ("..."):

PATCH /Groups/acbf3ae7-8463-4692-b4fd-9b4da3f908ce
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
If-Match: W"/a330bc54f0671c9"

{
  "schemas": [
    "urn:ietf:params:scim:api:messages:2.0:PatchOp"
  ],
  "Operations": [
    {
      "op": "replace",
      "path": "members",
      "value": [
        {
          "display": "Babs Jensen",
          "$ref": "https://example.com/v2/Users/2819c223...413861904646",
          "value": "2819c223...413861904646"
        },
        {
          "display": "James Smith",
          "$ref": "https://example.com/v2/Users/08e1d05d...473d93df9210",
          "value": "08e1d05d...473d93df9210"
        }
      ]
    }
  ]
}
The following example shows how to change a User’s entire "work" address using a "valuePath" filter. Note that by setting "primary" to "true", the service provider will reset primary to "false" for any other existing values of "addresses".

PATCH /Users/2819c223-7f76-453a-919d-413861904646
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
If-Match: W/"a330bc54f0671c9"

{  "schemas":  ["urn:ietf:params:scim:api:messages:2.0:PatchOp"],  "Operations": [{  "op": "replace",  "path": "addresses[type eq \"work\"]",  "value":  {  "type": "work",  "streetAddress": "911 Universal City Plaza",  "locality": "Hollywood",  "region": "CA",  "postalCode": "91608",  "country": "US",  "formatted": "911 Universal City Plaza\nHollywood, CA 91608 US",  "primary": true  }  }  ]}
The following example shows how to change a specific sub-attribute "streetAddress" of complex attribute "emails" selected by "valuePath" filter:

PATCH /Users/2819c223-7f76-453a-919d-413861904646
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
If-Match: W/"a330bc54f0671c9"

{
    "Operations": [{
        "op": "replace",
        "path": "addresses[type eq "work"].streetAddress",
        "value": "1010 Broadway Ave"
    }]
}
The following example shows how to replace all values of one or more specific attributes of a User resource. Note that other attributes are unaffected.

PATCH /Users/2819c223-7f76-453a-919d-413861904646
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
If-Match: W/"a330bc54f0671c9"

```
{
    "schemas":
        ["urn:ietf:params:scim:api:messages:2.0:PatchOp"],
    "Operations": [{
        "op":"replace",
        "value":{
            "emails":[
                {
                    "value":"bjensen@example.com",
                    "type":"work",
                    "primary":true
                },
                {
                    "value":"babs@jensen.org",
                    "type":"home"
                }
            ],
            "nickname":"Babs"
        }
    }
}
```

3.6. Deleting Resources

Clients request resource removal via DELETE. Service providers MAY choose not to permanently delete the resource, but MUST return a 404 error code for all operations associated with the previously deleted resource. Service providers MUST omit the resource from future query results. In addition the service provider SHOULD NOT consider the deleted resource in conflict calculation. For example if a User resource is deleted, a CREATE request for a User resource with the same userName as the previously deleted resource SHOULD NOT fail with a 409 error due to userName conflict.

DELETE /Users/2819c223-7f76-453a-919d-413861904646
Host: example.com
Authorization: Bearer h480djs93hd8
If-Match: W/"c310cd84f0281b7"
In response to a successful delete, the server SHALL respond with successful HTTP status 204 (No Content). A non-normative example response:

HTTP/1.1 204 No Content

Example: Client attempt to retrieve the previously deleted User

GET /Users/2819c223-7f76-453a-919d-413861904646
Host: example.com
Authorization: Bearer h480djs93hd8

Server Response:

HTTP/1.1 404 NOT FOUND

{
   "schemas": ["urn:ietf:params:scim:api:messages:2.0:Error"],
   "Errors": [
      {
         "description": "Resource 2819c223-7f76-453a-919d-413861904646 not found",
         "code": "404"
      }
   ]
}

3.7. Bulk Operations

The SCIM bulk operation is an optional server feature that enables clients to send a potentially large collection of resource operations in a single request. Support for bulk requests can be discovered by querying the service provider configuration (see Section 4). The body of a a bulk operation contains a set of HTTP resource operations using one of the API supported HTTP methods; i.e., POST, PUT, PATCH or DELETE.

Bulk requests are identified using the following schemas URI: "urn:ietf:params:scim:api:messages:2.0:BulkRequest". Bulk responses are identified using the following URI: "urn:ietf:params:scim:api:messages:2.0:BulkResponse". Bulk requests and bulk responses share many attributes. Unless otherwise specified, each attribute below is present in both bulk requests and bulk responses.

The following singular attribute is defined in addition to the common attributes defined in SCIM core schema.
failOnErrors
An Integer specifying the number of errors that the service provider will accept before the operation is terminated and an error response is returned. OPTIONAL in a request. Not valid in a response.

The following complex multi-valued attribute is defined in addition to the common attributes defined in core schema.

Operations
Defines operations within a bulk job. Each operation corresponds to a single HTTP request against a resource endpoint. REQUIRED. Operations has the following sub-attributes:

method The HTTP method of the current operation. Possible values are "POST", "PUT", "PATCH" or "DELETE". REQUIRED.

bulkId The transient identifier of a newly created resource, unique within a bulk request and created by the client. The bulkId serves as a surrogate resource id enabling clients to uniquely identify newly created resources in the Response and cross reference new resources in and across operations within a bulk request. REQUIRED when method is POST.

version The current resource version. Version MAY be used if the service provider supports ETags and the method is PUT, PATCH, or DELETE.

path The resource’s relative path to the SCIM service provider’s root. If the method is POST the value must specify a resource type endpoint; e.g., /Users or /Groups whereas all other method values must specify the path to a specific resource; e.g., /Users/2819c223-7f76-453a-919d-413861904646. REQUIRED in a request.

data The resource data as it would appear for a single POST, PUT or PATCH resource operation. REQUIRED in a request when method is POST, PUT and PATCH.

location The resource endpoint URL. REQUIRED in a response, except in the event of a POST failure.

response The HTTP response body to the specified request operation. When indicating a response with an HTTP status other than a 200 series response, the response body MUST be included. For normal completion, the server MAY elect to omit the response body.
status  The HTTP response status code to the requested operation. When indicating an error, the "response" attribute MUST contain the detailed error response as per Section 3.12.

If a bulk job is processed successfully the HTTP response code 200 OK MUST be returned, otherwise an appropriate HTTP error code MUST be returned.

The service provider MUST continue performing as many changes as possible and disregard partial failures. The client MAY override this behavior by specifying a value for the "failOnErrors" attribute. The failOnErrors attribute defines the number of errors that the service provider should accept before failing the remaining operations returning the response.

To be able to reference a newly created resource the attribute bulkId MAY be specified when creating new resources. The "bulkId" is defined by the client as a surrogate identifier in a POST operation (see Section 3.7.2). The service provider MUST return the same "bulkId" together with the newly created resource. The "bulkId" can then be used by the client to map the service provider id with the "bulkId" of the created resource.

A SCIM service provider MAY elect to optimize a sequence operations received (e.g., to improve processing performance). When doing so, the service provider MUST ensure the client’s intent is preserved and the same stateful result is achieved as for non-optimized processing. For example, before a "User" can be added to a "Group", they must first be created. Processing these requests out of order, might result in a failure to add the new "User" to the "Group".

3.7.1. Circular Reference Processing

The service provider MUST try to resolve circular cross references between resources in a single bulk job but MAY stop after a failed attempt and instead return the status code 409 Conflict. The following example exhibits the potential conflict.
POST /v2/Bulk
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
Content-Length: ...

{
  "schemas": ["urn:ietf:params:scim:api:messages:2.0:BulkRequest"],
  "Operations": [
    {
      "method": "POST",
      "path": "/Groups",
      "bulkId": "qwerty",
      "data": {
        "schemas": ["urn:ietf:params:scim:schemas:core:2.0:Group"],
        "displayName": "Group A",
        "members": [
          {
            "type": "Group",
            "value": "bulkId:ytrewq"
          }
        ]
      }
    },
    {
      "method": "POST",
      "path": "/Groups",
      "bulkId": "ytrewq",
      "data": {
        "schemas": ["urn:ietf:params:scim:schemas:core:2.0:Group"],
        "displayName": "Group B",
        "members": [
          {
            "type": "Group",
            "value": "bulkId:qwerty"
          }
        ]
      }
    }
  ]
}

If the service provider resolved the above circular references the following is returned from a subsequent GET request.
GET /v2/Groups?filter=displayName sw 'Group'
Host: example.com
Accept: application/scim+json
Authorization: Bearer h480djs93hd8

HTTP/1.1 200 OK
Content-Type: application/scim+json

{
    "schemas": ["urn:ietf:params:scim:api:messages:2.0:ListResponse"],
    "totalResults": 2,
    "Resources": [
    {
        "id": "c3a26dd3-27a0-4dec-a2ac-ce211e105f97",
        "schemas": ["urn:ietf:params:scim:schemas:core:2.0:Group"],
        "displayName": "Group A",
        "meta": {
            "resourceType": "Group",

                "$ref": "https://example.com/v2/Groups/6c5bb468-14b2-4183-baf2-06d523e03bd3",
                "type": "Group"
            }
        ]
    },
    {
        "id": "6c5bb468-14b2-4183-baf2-06d523e03bd3",
        "schemas": ["urn:ietf:params:scim:schemas:core:2.0:Group"],
        "displayName": "Group B",
        "meta": {
            "resourceType": "Group",
            "created": "2011-08-01T18:29:50.873Z",
            "lastModified": "2011-08-01T18:29:50.873Z",
            "location": "https://example.com/v2/Groups/6c5bb468-14b2-4183-baf2-06d523e03bd3",
            "version": "W/"wGB85s2QJMjiNnuI"
        },
        "members": [
            {
                "value": "6c5bb468-14b2-4183-baf2-06d523e03bd3",
                "$ref": "https://example.com/v2/Groups/6c5bb468-14b2-4183-baf2-06d523e03bd3",
                "type": "Group"
            }
        ]
    }
]
A SCIM client can, within one bulk operation, create a new "User", a new "Group" and add the newly created "User" to the newly created "Group". In order to add the new "User" to the "Group" the client must use the surrogate id attribute, "bulkId", to reference the User. The "bulkId" attribute value must be pre-pended with the literal "bulkId:"; e.g., if the bulkId is 'qwerty', the value is "bulkId:qwerty". The service provider MUST replace the string "bulkId:qwerty" with the permanent resource id once created.

To create multiple distinct requests, each with their own "bulkId", the SCIM client specifies different "bulkId" values for each separate request.
The following example creates a User with the "userName" ‘Alice’ and a "Group" with the "displayName" ‘Tour Guides’ with Alice as a member. Notice that each operation has its own "bulkId" value. However, the second operation (whose "bulkId" is "ytrewq") refers to the "bulkId" of "qwerty" in order to add Alice to new ‘Tour Guides’ group.

POST /v2/Bulk
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
Content-Length: ...

The service provider returns the following response:

HTTP/1.1 200 OK
Content-Type: application/json

```json
{
   "schemas": ["urn:ietf:params:scim:api:messages:2.0:BulkResponse"],
   "Operations": [
       {
           "location": "https://example.com/v2/Users/92b725cd-9465-4e7d-8c16-01f8e146b87a",
           "method": "POST",
           "bulkId": "qwerty",
           "version": "W/"4weymrEsh5O6cAEK"",
           "status": {
               "code": "201"
           }
       },
       {
           "location": "https://example.com/v2/Groups/e9e30dba-f08f-4109-8486-d5c6a331660a",
           "method": "POST",
           "bulkId": "ytrewq",
           "version": "W/"1ha5bbazU3fNvfe5"",
           "status": {
               "code": "201"
           }
       }
   ]
}
```

In the above example, the Alice User resource has an "id" of "92b725cd-9465-4e7d-8c16-01f8e146b87a" and the Tour Guides Group has an "id" of "e9e30dba-f08f-4109-8486-d5c6a331660a".
A subsequent GET request for the 'Tour Guides' Group (with an "id" of "e9e30dba-f08f-4109-8486-d5c6a331660a") returns the following with Alice's "id" as the value for the member in the Group 'Tour Guides':

HTTP/1.1 200 OK
Content-Type: application/scim+json
Location: https://example.com/v2/Groups/e9e30dba-f08f-4109-8486-d5c6a331660a
ETag: W/"lha5bbazU3fNvfe5"

{
    "schemas": ["urn:ietf:params:scim:schemas:core:2.0:Group"],
    "id": "e9e30dba-f08f-4109-8486-d5c6a331660a",
    "displayName": "Tour Guides",
    "meta": {
        "resourceType": "Group",
        "created": "2011-08-01T18:29:49.793Z",
        "lastModified": "2011-08-01T20:31:02.315Z",
        "location": "https://example.com/v2/Groups/e9e30dba-f08f-4109-8486-d5c6a331660a",
        "version": "W/"lha5bbazU3fNvfe5"
    },
    "members": [
        {
            "value": "92b725cd-9465-4e7d-8c16-01f8e146b87a",
            "$ref": "https://example.com/v2/Users/92b725cd-9465-4e7d-8c16-01f8e146b87a",
            "type": "User"
        }
    ]
}

Extensions that include references to other resources MUST be handled in the same way by the service provider. The following example uses the bulkId attribute within the enterprise extension managerId attribute.
3.7.3. Response and Error Handling

The service provider response MUST include the result of all processed operations. A "location" attribute that includes the resource's endpoint MUST be returned for all operations excluding failed POSTs. The status attribute includes information about the success or failure of one operation within the bulk job. The attribute status MUST include the code attribute that holds the HTTP
response code that would have been returned if a single HTTP request
would have been used. If an error occurred the status MUST also
include the description attribute containing a human readable
explanation of the error.

"status": "201"

The following is an example of a status in a failed operation.

"status": "400",
"response":{
   "schemas": ["urn:ietf:params:scim:api:messages:2.0:Error"],
   "scimType":"invalidSyntax"
   "detail":
   "Request is unparsable, syntactically incorrect, or violates schema.",
   "status":"400"
}

The following example shows how to add, update, and remove a user.
The "failOnErrors" attribute is set to '1' indicating the service
provider should return on the first error. The POST operation’s
bulkId value is set to ‘qwerty’ enabling the client to match the new
User with the returned resource id ‘92b725cd-9465-4e7d-8c16-01f8e146b87a’.

POST /v2/Bulk
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
Content-Length: ...

{  
   "schemas": ["urn:ietf:params:scim:api:messages:2.0:BulkRequest"],
   "failOnErrors":1,
   "Operations":[
   
       "method":"POST",
       "path":"/Users",
       "bulkId":"qwerty",
       "data":{
       "schemas": ["urn:ietf:params:scim:api:messages:2.0:User"],
       "userName":"Alice"
       }
   ],
   
}
"method": "PUT",
"path": "/Users/b7c14771-226c-4d05-8860-134711653041",
"version": "W/\"3694e05e9dff591\"",
"data": {
  "schemas": ["urn:ietf:params:scim:schemas:core:2.0:User"],
  "id": "b7c14771-226c-4d05-8860-134711653041",
  "userName": "Bob"
}
},
{
  "method": "PATCH",
  "path": "/Users/5d8d29d3-342c-4b5f-8683-a3cb6763ffcc",
  "version": "W/\"edac3253e2c0ef2\"",
  "data": [
    {
      "op": "remove",
      "path": "nickName"
    },
    {
      "op": "add",
      "path": "userName",
      "value": "Dave"
    }
  ]
}
},
{
  "method": "DELETE",
  "path": "/Users/e9025315-6bea-44e1-899c-1e07454e468b",
  "version": "W/\"0ee8add0a938e1a\"
}
}

The service provider returns the following response.
HTTP/1.1 200 OK
Content-Type: application/scim+json

{
  "schemas": ["urn:ietf:params:scim:api:messages:2.0:BulkResponse"],
  "Operations": [
    {
      "location": "https://example.com/v2/Users/92b725cd-9465-4e7d-8c16-01f8e146b87a",
      "method": "POST",
      "bulkId": "qwerty",
      "version": "W/\"oY4m4wn58tkVjXk\"
    },
    {
      "location": "https://example.com/v2/Users/b7c14771-226c-4d05-8860-134711653041",
      "method": "PUT",
      "version": "W/\"huJj29dMNgu3WXPD\"
    },
    {
      "location": "https://example.com/v2/Users/5d8d29d3-342c-4b5f-8683-a3cb6763ffcc",
      "method": "PATCH",
      "version": "W/\"huJj29dMNgu3WXPD\"
    },
    {
      "location": "https://example.com/v2/Users/e9025315-6bea-44e1-899c-1e07454e468b",
      "method": "DELETE"
    }
  ]
}

The following response is returned if an error occurred when attempting to create the User ‘Alice’. The service provider stops processing the bulk operation and immediately returns a response to the client. The response contains the error and any successful results prior to the error.
HTTP/1.1 200 OK
Content-Type: application/scim+json

{
   "schemas": ["urn:ietf:params:scim:api:messages:2.0:BulkResponse"],
   "Operations": [
      {
         "method": "POST",
         "bulkId": "qwerty",
         "status": "400",
         "response": {
            "schemas": ["urn:ietf:params:scim:api:messages:2.0:Error"],
            "scimType": "invalidSyntax"
            "detail": "Request is unparsable, syntactically incorrect, or violates schema.",
            "status": "400"
         }
      }
   ]
}

If the "failOnErrors" attribute is not specified or the service provider has not reached the error limit defined by the client the service provider will continue to process all operations. The following is an example in which all operations failed.

HTTP/1.1 200 OK
Content-Type: application/scim+json

{
   "schemas": ["urn:ietf:params:scim:api:messages:2.0:BulkResponse"],
   "Operations": [
      {
         "method": "POST",
         "bulkId": "qwerty",
         "status": "400",
         "response": {
            "schemas": ["urn:ietf:params:scim:api:messages:2.0:Error"],
            "scimType": "invalidSyntax"
            "detail": "Request is unparsable, syntactically incorrect, or violates schema.",
            "status": "400"
         }
      },
      {
         "location": "https://example.com/v2/Users/b7c14771-226c-4d05-8860-134711653041",
      }
   ]
}
"method": "PUT",
"status": "412",
"response":{
    "schemas": ["urn:ietf:params:scim:api:messages:2.0:Error"],
    "detail": "Failed to update. Resource changed on the server.",
    "status": "412"
}
},
{
    "location": "https://example.com/v2/Users/5d8d29d3-342c-4b5f-8683-a3cb6763ffcc",
    "method": "PATCH",
    "status": "412",
    "response":{
        "schemas": ["urn:ietf:params:scim:api:messages:2.0:Error"],
        "detail": "Failed to update. Resource changed on the server.",
        "status": "412"
    }
},
{
    "location": "https://example.com/v2/Users/e9025315-6bea-44e1-899c-1e07454e468b",
    "method": "DELETE",
    "status": "404",
    "response":{
        "schemas": ["urn:ietf:params:scim:api:messages:2.0:Error"],
        "detail": "Resource does not exist.",
        "status": "404"
    }
}
}

3.7.4. Maximum Operations

The service provider MUST define the maximum number of operations and maximum payload size a client may send in a single request. These limits MAY be retrieved from the service provider Configuration (see ‘bulk’ in Section 5 and 8.5 of [I-D.ietf-scim-core-schema]). If either limits are exceeded the service provider MUST return the HTTP response code 413 Request Entity Too Large. The returned response MUST specify the limit exceeded in the body of the error response.
The following example the client sent a request exceeding the service provider’s max payload size of 1 megabyte:

POST /v2/Bulk
Host: example.com
Accept: application/scim+json
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
Content-Length: 4294967296

...

In response to the over-sized request, the server responds with the following error:

HTTP/1.1 413 Request Entity Too Large
Content-Type: application/scim+json

{
    "schemas": ["urn:ietf:params:scim:api:messages:2.0:Error"],
    "status": "413",
    "detail":
    "The size of the bulk operation exceeds the maxPayloadSize (1048576)."
}

3.8. Data Input/Output Formats

Servers MUST accept requests and be able to respond with JSON structured responses using UTF-8 encoding [RFC3629], UTF-8 SHALL be the default encoding format. Other media types MAY be supported by service providers but are beyond the scope of this specification.

Clients using other encodings MUST specify the format in which the data is submitted via HTTP header "Content-Type" as specified in Section 3.1.1.5 [RFC7231] and MAY specify the desired response data format via an HTTP "Accept" header (Section 5.3.2 [RFC7231]); e.g., "Accept: application/scim+json" or via URI suffix; e.g.,

GET/Users/2819c223-7f76-453a-919d-413861904646.scim
Host: example.com

Service providers MUST support the accept header "Accept: application/scim+json" and SHOULD support header "Accept: application/json" both of which specify JSON documents conforming to [RFC7159]. The format defaults to "application/scim+json" if no format is specified.
Singular attributes are encoded as string name-value-pairs in JSON; e.g.,

"attribute": "value"

Multi-valued attributes in JSON are encoded as arrays; e.g.,

"attributes": [ "value1", "value2" ]

Elements with nested elements are represented as objects in JSON; e.g,

"attribute": { "subattribute1": "value1", "subattribute2": "value2" }

3.9. Additional Operation Response Parameters

For any SCIM operation where a resource representation is returned (e.g., HTTP GET), the attributes returned are defined as the minimum attribute set plus default attributes set. The minimum set are those attributes that have their "returned" characteristic set to "always" (see Section 2.2 of [I-D.ietf-scim-core-schema]). The default attribute set are those attributes that have the "returned" characteristic set to "default".

Clients MAY request a partial resource representation on any operation that returns a resource within the response by specifying either of the mutually exclusive URL query parameters "attributes" or "excludedAttributes" as follows:

attributes When specified the default list of attributes SHALL be overridden and each resource returned MUST contain the minimum set of resource attributes and any attributes or sub-attributes explicitly requested by the "attributes" parameter. The query parameter attributes value is a comma separated list of resource attribute names in standard attribute notation (Section 3.10) form (e.g., userName, name, emails).

excludedAttributes When specified, each resource returned MUST contain the minimal set of resource attributes. Additionally, the default set of attributes minus those attributes listed in "excludedAttributes" are also returned. The query parameter attributes value is a comma separated list of resource attribute names in standard attribute notation (Section 3.10) form (e.g., userName, name, emails).
GET /Users/2819c223-7f76-453a-919d-413861904646?attributes=userName
Host: example.com
Accept: application/scim+json
Authorization: Bearer h480djs93hd8

Giving the response

HTTP/1.1 200 OK
Content-Type: application/scim+json
Location: https://example.com/v2/Users/2819c223-7f76-453a-919d-413861904646
ETag: W/"a330bc54f0671c9"

{
  "schemas": ["urn:ietf:params:scim:schemas:core:2.0:User"],
  "id": "2819c223-7f76-453a-919d-413861904646",
  "userName": "bjensen"
}

3.10. Attribute Notation

All operations share a common scheme for referencing simple and complex attributes. In general, attributes are uniquely identified by prefixing the attribute name with its schema URN separated by a colon (":") character; e.g., the core User resource attribute ‘userName’ is identified as "urn:ietf:params:scim:schemas:core:2.0:User:userName". Clients MAY omit core schema attribute URN prefixes but SHOULD fully qualify extended attributes with the associated schema extension URN to avoid naming conflicts. For example, the attribute ‘age’ defined in "urn:ietf:params:scim:schemas:exampleCo:2.0:hr" is uniquely identified as "urn:ietf:params:scim:schemas:exampleCo:2.0:hr:age". Complex attributes’ sub-attributes are referenced via nested, dot (‘.’) notation; i.e., {urn}::{Attribute name}.{Sub-Attribute name}. For example, the fully qualified path for a User’s givenName is "urn:ietf:params:scim:schemas:core:2.0:User:name.givenName" All facets (URN, attribute and Sub-Attribute name) of the fully encoded Attribute name are case insensitive.

3.11. "/Me" Authenticated Subject Alias

A client MAY use a URL of the form "<base-URI>/Me" as a URI alias for the User or other resource associated with the currently authenticated subject for any SCIM operation. A service provider MAY respond in one of 3 ways:
A service provider that does NOT support this feature SHOULD respond with status 501 (NOT IMPLEMENTED).

A service provider MAY choose to redirect the client using HTTP status 308 to the resource associated with the authenticated subject. The client MAY then repeat the request at the indicated location.

A service provider MAY process the SCIM request directly. In any response, the HTTP "Location" header MUST be the permanent location of the aliased resource associated with the authenticated subject.

When using the SCIM Create Resource command (HTTP POST) with the "/Me" alias, the desired resourceType being created is at the discretion of the service provider based on the authenticated subject (if not anonymous) making the request and any request body attributes (e.g., "schemas"). See Section 7.6 for information on security considerations related to this operation.

3.12. HTTP Status and Error Response Handling

The SCIM Protocol uses the HTTP status response status codes defined in Section 6 [RFC7231] to indicate operation success or failure. In addition to returning a HTTP response code implementers MUST return the errors in the body of the response in the client requested format containing the error response and, per the HTTP specification, human-readable explanations. Error responses are identified using the following "schema" URI: "urn:ietf:params:scim:api:messages:2.0:Error". The following attributes are defined for a SCIM error response using a JSON body:

status
  The HTTP status code (see Section 6 [RFC7231]) expressed as a JSON String. REQUIRED

scimType
  A SCIM detailed error keyword. See Table 9. OPTIONAL

detail
  A detailed, human readable message. OPTIONAL

Implementers SHOULD handle the identified HTTP status codes as described below.

<table>
<thead>
<tr>
<th>Status</th>
<th>Applicability</th>
<th>Suggested Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>--------------</td>
<td>---------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>Status Code</td>
<td>Methods</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>307</td>
<td>GET, POST, PUT, PATCH, DELETE</td>
<td>The client is directed to repeat the same HTTP request at the location identified. The client SHOULD NOT use the location provided in the response as a permanent reference to the resource and SHOULD continue to use the original request URI [RFC7231].</td>
</tr>
<tr>
<td>308</td>
<td>GET, POST, PUT, PATCH, DELETE</td>
<td>The client is directed to repeat the same HTTP request at the location identified. The client SHOULD use the location provided in the response as the permanent reference to the resource [RFC7538].</td>
</tr>
<tr>
<td>400</td>
<td>GET, POST, PUT, PATCH, DELETE</td>
<td>Request is unparsable, syntactically incorrect, or violates schema</td>
</tr>
<tr>
<td>401</td>
<td>GET, POST, PUT, PATCH, DELETE</td>
<td>Authorization failure. The authorization header is invalid or missing.</td>
</tr>
<tr>
<td>403</td>
<td>GET, POST, PUT, PATCH, DELETE</td>
<td>Operation is not permitted based on the supplied authorization.</td>
</tr>
<tr>
<td>404</td>
<td>GET, POST, PUT, PATCH, DELETE</td>
<td>Specified resource (e.g., User) or end-point, does not exist</td>
</tr>
<tr>
<td>409</td>
<td>POST, PUT, PATCH, DELETE</td>
<td>The specified version number does not match the resource’s latest version number or a service provider refused to create a new, duplicate resource</td>
</tr>
<tr>
<td>412</td>
<td>PUT, PATCH, DELETE</td>
<td>Failed to update as resource {id} changed on the server last retrieved</td>
</tr>
<tr>
<td>413</td>
<td>POST</td>
<td>Failed as resource {id} is not a multiple of 1000, maxPayload: 1048576</td>
</tr>
<tr>
<td>500</td>
<td>GET, POST, PUT, PATCH, DELETE</td>
<td>An internal error. Implementers SHOULD provide descriptive debugging advice</td>
</tr>
<tr>
<td>501</td>
<td>GET, POST, PUT, PATCH, DELETE</td>
<td>Service Provider does not support the request operation; e.g., PATCH</td>
</tr>
</tbody>
</table>

Table 8: SCIM HTTP Status Code Usage
For HTTP Status 400 (Bad Request) responses, the following detail error types are defined:

<table>
<thead>
<tr>
<th>scimType</th>
<th>Description</th>
<th>Applicability</th>
</tr>
</thead>
<tbody>
<tr>
<td>invalidFilter</td>
<td>The specified filter syntax was invalid (does not comply with Figure 1) or the specified attribute and filter comparison combination is not supported.</td>
<td>GET (Section 3.4.2), POST (Search - Section 3.4.3), PATCH (Path Filter - Section 3.5.2)</td>
</tr>
<tr>
<td>tooMany</td>
<td>The specified filter yields many more results than the server is willing calculate or process. For example, a filter such as &quot;(userName pr)&quot; by itself would return all entries with a &quot;userName&quot; and MAY not be acceptable to the service provider.</td>
<td>GET (Section 3.4.2), POST (Search - Section 3.4.3)</td>
</tr>
<tr>
<td>uniqueness</td>
<td>One or more of attribute values is already in use or is reserved.</td>
<td>POST (Create - Section 3.3), PUT (Section 3.5.1), PATCH (Section 3.5.2)</td>
</tr>
<tr>
<td>mutability</td>
<td>The attempted modification is not compatible with the target attributes mutability or current state (e.g., modification of an immutable attribute with an existing value).</td>
<td>PUT (Section 3.5.1), PATCH (Section 3.5.2)</td>
</tr>
<tr>
<td>invalidSyntax</td>
<td>The request body message structure was invalid or did not conform to the request schema.</td>
<td>POST (Search - Section 3.4.2), Create - Section 3.3, Bulk - Section 3.7, PUT (Section 3.5.1)</td>
</tr>
<tr>
<td>invalidPath</td>
<td>The path attribute was invalid or malformed (see Figure 7).</td>
<td>PATCH (Section 3.5.2)</td>
</tr>
<tr>
<td>noTarget</td>
<td>The specified &quot;path&quot; did not yield an attribute or attribute value that could be operated on. This occurs</td>
<td>PATCH (Section 3.5.2)</td>
</tr>
</tbody>
</table>
when the specified "path" value contains a filter that yields no match.

invalidValue  A required value was missing, or the value specified was not compatible with the operation or attribute type (see Section 2.2 [I-D.ietf-scim-core-schema]), or resource schema (see Section 4 [I-D.ietf-scim-core-schema]).

invalidVers  The specified SCIM protocol version is not supported (see Section 3.13).

sensitive  The specified request cannot be completed due to passing of sensitive (e.g., personal) information in a request URI. For example, personal information SHALL NOT be transmitted over request URIs. See Section 7.5.2.

+-------------------+----------------------------------+
| error             | description                      |
| invalidValue      | A required value was missing, or  |
|                   | the value specified was not  |
|                   | compatible with the operation or  |
|                   | attribute type (see Section 2.2 |
|                   | [I-D.ietf-scim-core-schema]), |
|                   | or resource schema (see Section 4 |
|                   | [I-D.ietf-scim-core-schema]).    |
| invalidVers       | The specified SCIM protocol       |
|                   | version is not supported          |
|                   | (see Section 3.13).               |
| sensitive         | The specified request cannot      |
|                   | be completed due to passing of   |
|                   | sensitive (e.g., personal)        |
|                   | information in a request URI.     |
|                   | For example, personal information |
|                   | SHALL NOT be transmitted over     |
|                   | request URIs. See Section 7.5.2.  |
|                   | GET (Section 3.4.2), POST (ALL), |
|                   | PUT (Section 3.5.1), PATCH (Section 3.5.2), DELETE (Section 3.6) |
|                   | GET (Section 3.4.2).             |

Table 9: Table of SCIM Detail Error Keyword Values

Note that in the table above (Table 9), the applicability table applies to the normal HTTP method but MAY apply within a SCIM Bulk operation (via HTTP POST).

Error example in response to a non-existent GET request.

HTTP/1.1 404 NOT FOUND

```
{
  "schemas": ["urn:ietf:params:scim:api:messages:2.0:Error"],
  "detail": "Resource 2819c223-7f76-453a-919d-413861904646 not found",
  "status": "404"
}
```

Error example in response to a PUT request.
HTTP/1.1 400 BAD REQUEST

{
  "schemas": ["urn:ietf:params:scim:api:messages:2.0:Error"],
  "scimType":"mutability",
  "detail":"Attribute ‘id’ is readOnly",
  "status": "400"
}

3.13. SCIM Protocol Versioning

The Base URL MAY be appended with a version identifier as a separate segment in the URL path. At this time of this specification, the identifier is ‘v2’ . If specified, the version identifier MUST appear in the URL path immediately preceding the resource endpoint and conform to the following scheme: the character ‘v’ followed by the desired SCIM version number; e.g., a version ‘v2’ User request is specified as /v2/Users. When specified service providers MUST perform the operation using the desired version or reject the request. When omitted service providers SHOULD perform the operation using the most recent SCIM protocol version supported by the service provider.

3.14. Versioning Resources

The SCIM protocol supports resource versioning via standard HTTP ETags Section 2.3 [RFC7232]. Service providers MAY support weak ETags as the preferred mechanism for performing conditional retrievals and ensuring clients do not inadvertently overwrite each others changes, respectively. When supported, SCIM ETags MUST be specified as an HTTP header and SHOULD be specified within the ‘version’ attribute contained in the resource’s ‘meta’ attribute.
Example create request:

POST /Users HTTP/1.1
Host: example.com
Content-Type: application/scim+json
Authorization: Bearer h480djs93hd8
Content-Length: ...

{
  "schemas": ["urn:ietf:params:scim:schemas:core:2.0:User"],
  "userName": "bjensen",
  "externalId": "bjensen",
  "name": {
    "formatted": "Ms. Barbara J Jensen III",
    "familyName": "Jensen",
    "givenName": "Barbara"
  }
}

The server responds with an ETag in the response header and meta structure.

HTTP/1.1 201 Created
Content-Type: application/scim+json
Location: https://example.com/v2/Users/2819c223-7f76-453a-919d-413861904646
ETag: W/"e180ee84f0671b1"

{
  "schemas": ["urn:ietf:params:scim:schemas:core:2.0:User"],
  "id": "2819c223-7f76-453a-919d-413861904646",
  "meta": {
    "resourceType": "User",
    "created": "2011-08-01T21:32:44.882Z",
    "lastModified": "2011-08-01T21:32:44.882Z",
    "location": "https://example.com/v2/Users/2819c223-7f76-453a-919d-413861904646",
    "version": "W/"e180ee84f0671b1"
  },
  "name": {
    "formatted": "Ms. Barbara J Jensen III",
    "familyName": "Jensen",
    "givenName": "Barbara"
  },
  "userName": "bjensen"
}
With the returned ETag, clients MAY choose to retrieve the resource only if the resource has been modified.

Conditional retrieval example using If-None-Match Section 3.2 [RFC7233] header:

GET /Users/2819c223-7f76-453a-919d-413861904646?attributes=displayName
Host: example.com
Accept: application/scim+json
Authorization: Bearer h480djs93hd8
If-None-Match: W/"e180ee84f0671b1"

If the resource has not changed the service provider simply returns an empty body with a 304 "Not Modified" response code.

If the service providers supports versioning of resources the client MAY supply an If-Match Section 3.2 [RFC7233] header for PUT and PATCH operations to ensure that the requested operation succeeds only if the supplied ETag matches the latest service provider resource; e.g., If-Match: W/"e180ee84f0671b1"

4. Service Provider Configuration Endpoints

SCIM 2 defines 3 endpoints to facilitate discovery of SCIM service provider features and schema that MAY be retrieved using HTTP GET:

/SERVICEPROVIDERCORE
An HTTP GET to this endpoint will return a JSON structure that describes the SCIM specification features available on a service provider. This endpoint SHALL return responses with a JSON object using a "schemas" attribute of "urn:ietf:params:scim:schemas:core:2.0:ServiceProviderConfig". The attributes returned in the JSON object are defined in Section 5 [I-D.ietf-scim-core-schema]. An example representation of SCIM service provider configuration may be found in Section 8.5 [I-D.ietf-scim-core-schema].

/Schemas
An HTTP GET to this endpoint is used to retrieve information about resource schemas supported by a SCIM service provider. An HTTP GET to the endpoint "/Schemas" SHALL return all supported schemas in ListResponse format (see Figure 3). Individual schema definitions can be returned by appending the schema URI to the schemas endpoint. For example:

The contents of each schema returned is described in Section 7 [I-D.ietf-scim-core-schema]. An example representation of SCIM schemas may be found in Section 8.7 [I-D.ietf-scim-core-schema].

/ResourceTypes
An HTTP GET to this endpoint is used to discover the types of resources available on a SCIM service provider (e.g., Users and Groups). Each resource type defines the endpoints, the core schema URI that defines the resource, and any supported schema extensions. The attributes defining a resource type can be found in Section 6 [I-D.ietf-scim-core-schema], and an example representation can be found in Section 8.6 [I-D.ietf-scim-core-schema].

In cases where a request is for a specific "ResourceType" or "Schema", the single JSON object is returned in the same way a single User or Group is retrieved as per Section 3.4.1. When returning multiple ResourceTypes or Schemas, the message form described by "urn:ietf:params:scim:api:messages:2.0:ListResponse" (ListResponse) form SHALL be used as shown in Figure 3 and Figure 9 below. Query parameters described in section 3.2 such as, sorting, attributes, and paging SHALL be ignored. If a "filter" is provided, the service provider SHOULD respond with HTTP Status 403 (FORBIDDEN) to ensure clients cannot incorrectly assume any matching conditions specified in a filter are true.
The following is a non-normative example of an HTTP GET to the `/ResourceTypes` endpoint:

```json
{
    "totalResults":2,
    "itemsPerPage":10,
    "startIndex":1,
    "schemas": ["urn:ietf:params:scim:api:messages:2.0:ListResponse"],
    "Resources": [
        {
            "schemas": ["urn:ietf:params:scim:schemas:core:2.0:ResourceType"],
            "id": "User",
            "name": "User",
            "endpoint": "/Users",
            "description": "User Account",
            "schemaExtensions": [{
                "required": true
            }],
            "meta": {
                "location": "https://example.com/v2/ResourceTypes/User",
                "resourceType": "ResourceType"
            }
        },
        {
            "schemas": ["urn:ietf:params:scim:schemas:core:2.0:ResourceType"],
            "id": "Group",
            "name": "Group",
            "endpoint": "/Groups",
            "description": "Group",
            "schema": "urn:ietf:params:scim:schemas:core:2.0:Group",
            "meta": {
                "location": "https://example.com/v2/ResourceTypes/Group",
                "resourceType": "ResourceType"
            }
        }
    ]
}
```

Figure 9: Example Resource Type JSON Representation

5. Preparation and Comparison of Internationalized Strings

To increase the likelihood that the input and comparison of usernames and passwords will work in ways that make sense for typical users throughout the world, there are rules for preparing, enforcing, and comparing internationalized strings that represent usernames and passwords. Before comparing or evaluating uniqueness of a "userName"
or "password" attribute, service providers MUST use the "PRECIS"
profile described in Sections 4 and 5 respectively of
[I-D.ietf-precis-saslprepbis] which is based on the "PRECIS"
framework specification [I-D.ietf-precis-framework].

6. Multi-Tenancy

A single service provider may expose the SCIM protocol to multiple
clients. Depending on the nature of the service, the clients may
have authority to access and alter resources initially created by
other clients. Alternatively, clients may expect to access disjoint
sets of resources, and may expect that their resources are
inaccessible by other clients. These scenarios are called "multi-
tenancy", where each client is understood to be or represent a
"tenant" of the service provider. Clients may also be multi-
tenanted.

The following common cases may occur:

1. All clients share all resources (no tenancy)

2. Each single client creates and accesses a private subset of
   resources (1 client:1 Tenant)

3. Sets of clients share sets of resources (M clients:1 Tenant)

4. One client to Multiple Tenants (1 client:M Tenants)

Service providers may implement any subset of the above cases.

Multi-Tenancy is OPTIONAL. The SCIM protocol does not define a
scheme for multi-tenancy.

The SCIM protocol does not prescribe the mechanisms whereby clients
and service providers interact for:

- Registering or provisioning Tenants
- Associating a subset of clients with a subset of the Tenants
- Indicating which tenant is associated with the data in a request
  or response, or indicating which Tenant is the subject of a query

6.1. Associating Clients to Tenants

The service provider MAY use the authentication mechanism (Section 2)
to determine the identity of the client, and thus infer the
associated Tenant.
For implementations where a client is associated with more than one Tenant, the service provider MAY use one of the following methods for explicit specification of the Tenant.

If any of these methods of allowing the client to explicitly specify the Tenant are employed, the service provider should ensure that access controls are in place to prevent or allow cross-tenant use cases.

The service provider should consider precedence in cases where a client may explicitly specify a Tenant while being implicitly associated with a different Tenant.

In all of these methods, the \{tenant_id\} is a unique identifier for the Tenant as defined by the service provider.

- A URL prefix: "https://www.example.com/Tenants/{tenant_id}/v2/Users"
- A sub-domain: "https://{tenant_id}.example.com/v2/Groups"
- The service provider may recognize a \{tenant_id\} provided by the client in an HTTP Header as the indicator of the desired target Tenant.

6.2. SCIM Identifiers with Multiple Tenants

Considerations for a Multi-Tenant Implementation:

The service provider may choose to implement SCIM ids which are unique across all resources for all Tenants, but this is not required.

The externalId, defined by the client, is required to be unique ONLY within the resources associated with the associated Tenant.

7. Security Considerations

7.1. HTTP Considerations

SCIM Protocol layers on top of Hypertext Transfer Protocol and thus subject to the security considerations of HTTP Section 9 [RFC7230] and its related specifications.

As stated in Section 2.7.1 [RFC7230], a SCIM client MUST NOT generate the "userinfo" (i.e., username and password) component (and its "@" delimiter) when an "http" URI reference is generated with a message as they are now disallowed in HTTP.
7.2. TLS Support Considerations

SCIM resources (e.g., Users and Groups) contain sensitive information including passwords. Therefore, SCIM clients and service providers MUST require the use of a transport-layer security mechanism when communicating with SCIM service providers. The SCIM service provider MUST support TLS 1.2 [RFC5246] and MAY support additional transport-layer mechanisms meeting its security requirements. When using TLS, the client MUST perform a TLS/SSL server certificate check, per [RFC6125]. Implementation security considerations for TLS can be found in "Recommendations for Secure Use of TLS and DTLS" [RFC7525].

7.3. Authorization Token Considerations

When using authorization tokens such as those issued by OAuth 2.0 [RFC6749], implementers MUST take into account threats and countermeasures documented in Section 8 of [I-D.ietf-oauth-assertions].

7.4. Bearer and Cookie Considerations

Since the possession of a bearer token or cookie MAY authorize the holder to potentially read, modify, or delete resources, tokens and cookies MUST contain sufficient entropy to prevent a random guessing attack, such as described in Section 5.2 of [RFC6750] and Section 5.1.4.2.2 of [RFC6819].

As with all SCIM communications, Bearer tokens and HTTP cookies MUST be exchanged using TLS.

Bearer tokens MUST have a limited lifetime that can be determined directly or indirectly (e.g., by checking with a validation service) by the service provider. By expiring tokens, clients are forced to obtain a new token (which usually involves re-authentication) for continued authorized access. For example, in OAuth2, a client MAY use OAuth token refresh to obtain a new bearer token after authenticating to an authorization server. See Section 6 of [RFC6749].

As with Bearer tokens, an HTTP cookie SHOULD last no longer than the lifetime of a browser session. An expiry time should be set that limits session cookie lifetime as per Section 5.2.1 of [RFC6265].

Implementations supporting OAuth bearer tokens need to factor in security considerations of this authorization method [I-D.ietf-oauth-assertions]. Since security is only as good as the weakest link, implementers also need to consider authentication choices coupled with OAuth bearer tokens. The security
considerations of the default authentication method for OAuth bearer tokens, HTTP BASIC, are well documented in [I-D.ietf-httpauth-basicauth-update], therefore implementers are encouraged to prefer stronger authentication methods. Designating the specific methods of authentication and authorization are out-of-scope for SCIM, however this information is provided as a resource to implementers.

7.5. Privacy Considerations

7.5.1. Personal Information

The SCIM Core Schema specifications defines attributes that may contain personally identifying information as well as other sensitive personal data. The privacy considerations in the Security Considerations Section of [I-D.ietf-scim-core-schema] MUST be considered.

7.5.2. Disclosure of Sensitive Information in URIs

As mentioned in Section 9.4 [RFC7231], SCIM clients requesting information using query filters using HTTP GET SHOULD give consideration to the information content of the filters and whether their exposure in a URI would represent a breach of security or confidentiality through leakage in a web browsers or server logs. This is particularly true for information that is legally considered "personally identifiable information" or is otherwise restricted by privacy laws. In these situations to ensure maximum security and confidentiality, clients SHOULD query using HTTP POST (see Section 3.4.3).

Servers that receive HTTP GET requests using filters that contain sensitive or confidential personal information SHOULD respond with HTTP status 403 indicating the operation is FORBIDDEN. A "scimType" error of "sensitive" may be returned indicating the request must be submitted using POST. A non-normative example:

HTTP/1.1 403 FORBIDDEN

{
   "schemas": ["urn:ietf:params:scim:api:messages:2.0:Error"],
   "detail":
      "Query filter involving 'name' is restricted or confidential",
   "scimType": "sensitive",
   "status": "404"
}
7.6. Anonymous Requests

If a SCIM service provider accepts anonymous requests such as SCIM resource creation requests (via HTTP POST), appropriate security measures should be put in place to prevent or limit exposure to attacks. The following counter-measures MAY be used:

- Try to authenticate web UI components that formulate the SCIM creation request. While the end-user may be anonymous, the web user interface component often has its own way to authenticate to the SCIM service provider (e.g., has an OAuth client credential [RFC6749]) and the web user interface component may implement its own measures (e.g., such as CAPTCHA) to ensure a legitimate request is being made.

- Limit the number of requests any particular client MAY make in a period of time.

- For User resources, default newly created resource with an "active" setting of "false" and use a secondary confirmation process (e.g., email confirmation) to ensure the resource created is real.

7.7. Secure Storage and Handling of Sensitive Data

An attacker may obtain valid username/password combinations from the SCIM service provider’s underlying database by gaining access to the database and/or launching injection attacks. This could lead to unintended disclosure of username/password combinations. The impact may extend beyond the domain of the SCIM service provider if the data was provisioned from other domains.

Administrators should undertake industry best practices to protect the storage of credentials and in particular SHOULD follow recommendations outlines in Section 5.1.4.1 [RFC6819]. These recommendations include but are not limited to:

- Provide injection attack counter measures (e.g., by validating all inputs and parameters),

- No cleartext storage of credentials,

- Store credentials using an encrypted protection mechanism, and

- Avoid passwords and consider use of asymmetric cryptography based credentials.
As outlined in Section 5.1.4.2 [RFC6819], administrators SHOULD take counter measures to prevent online attacks on secrets such as:

- Utilize secure password policy in order to increase user password entropy to hinder online attacks and password guessing,
- Mitigate attacks on passwords by locking respective accounts have a number of failed attempts,
- Use "tar pit" techniques by temporarily locking a respective account and delaying responses for a certain duration. The duration may increase with the number of failed attempts, and
- Use authentication system that use CAPTCHA’s and other factors for authenticating users further reducing the possibility of automated attacks.

Service providers SHOULD define an access control model that differentiates between individual client applications and their specific need to access information, and any User self-service rights to review and update personal profile information. This may include OAuth 2.0 delegation profiles, that allow client systems to act on behalf of user’s with their permission.

7.8. Case Insensitive Comparison & International Languages

When comparing unicode strings such as in query filters or testing for uniqueness of usernames and passwords, strings MUST be appropriately prepared before comparison. See Section 5.

8. IANA Considerations

8.1. Media Type Registration

To: ietf-types@iana.org
Subject: Registration of media type application/scim+json

Type name: application
Subtype name: scim+json
Required parameters: none
Optional parameters: none
Encoding considerations: 8bit
Security considerations: See Section 7

Interoperability considerations: The "application/scim+json" media type is intended to identify JSON structure data that conforms to the SCIM protocol and schema specifications. Older versions of SCIM are known to informally use "application/json".

Published specification: [[this document]]

Applications that use this media type: It is expected that applications that use this type may be special purpose applications intended for inter-domain provisioning. Clients may also be applications (e.g., mobile applications) that need to use SCIM for self-registration of user accounts. SCIM services may be offered by web applications that offer support for standards based provisioning or may be a dedicated SCIM service provider such as a "cloud directory”. Content may be treated as equivalent to "application/json" type for the purpose of displaying in web browsers.

Additional information:

Magic number(s):

File extension(s): .scim .scm

Macintosh file type code(s):

Person & email address to contact for further information: SCIM mailing list "<scim@ietf.org>"

Intended usage: COMMON* (see restrictions)

Restrictions on usage: For most client types, it is sufficient to recognize the content as equivalent to "application/json". Applications intending to use SCIM protocol SHOULD use the application/scim+json media type.

Author: Phil Hunt

Change controller: IETF

8.2. SCIM Message URI Registry

As per the IANA SCIM Schema Registry in [I-D.ietf-scim-core-schema], the following registers and extends the SCIM Schema Registry to define SCIM protocol request/response JSON schema URN identifier prefix of "urn:ietf:params:scim:api:messages:2.0" which is part of
the URN sub-Namespace for SCIM. There is no specific associated resource type.

+---------------------------------+-----------------+---------------+
| Schema URI                      | Name            | Reference     |
|---------------------------------+-----------------+---------------|
| urn:ietf:params:scim:api:       | List/Query      | See Section   |
| messages:2.0:ListResponse       | Response        | 3.4.2         |
| urn:ietf:params:scim:api:       | POST Query      | See Section   |
| messages:2.0:SearchRequest      | Request         | 3.4.3         |
| urn:ietf:params:scim:api:       | Patch Operation | See Section   |
| messages:2.0:PatchOp            |                 | 3.5.2         |
| urn:ietf:params:scim:api:       | Bulk Operations | See Section   |
| messages:2.0:BulkRequest        | Request         | 3.7           |
| urn:ietf:params:scim:api:       | Bulk Operations | See Section   |
| messages:2.0:BulkResponse       | Response        | 3.7           |
| urn:ietf:params:scim:api:       | Error Response  | See Section   |
| messages:2.0:Error              |                 | 3.12          |

Appendix C. Change Log

[[This section to be removed prior to publication as an RFC]]

Draft 02 - KG - Addition of schema extensibility

Draft 03 - PH - Revisions based on following tickets:

24 - Add filter negation
39 - Clarification on response for DELETE
42 - Make root searches optional
49 - Add "ew" filter
50 - Filters for multi-valued complex attributes
51 - Search by Schema
53 - Standard use of term client (some was consumer)
55 - Redirect support (3xx)
56 - Make manager attribute consistent with other $ref attrs
57 - Update all "/v1" examples to '/v2"

59 - Fix capitalization per IETF editor practices

60 - Changed <eref> tags to normal <xref> and <reference> tags

Draft 04 - PH - Revisions based on the following tickets:

18 - New PATCH command based on JSON Patch (RFC6902)
- Provided ABNF specification for filters (used in PATCH)
- Updated references to RFC4627 to RFC7159

Draft 05 - PH - Revisions based on the following tickets:

03 - Support for excludedAttributes parameter

13 - Change client use of Etags from MUST to MAY (correction)

23 - Clarifications regarding case exact processing.

41 - Add IANA considerations

65 - Removed X-HTTP-Method-Override support

69 - Added clarifications to intro to align with draft-nottingham-uri-get-off-my-lawn

70 - Remove SCIM_TENANT_ID header

72 - Added text to indicate UTF-8 is default and mandatory encoding format per BCP18

74 - Added security considerations for using GET with confidential attribute filters
- corrected error response in JSON PATCH operation

Draft 06 - PH - Revisions based on the following tickets and editorial changes

41 - Revised content types from application/json to application/scim+json, registered API schemas

63 - Revised uri schema prefixes for API json message schemas

66 - Updated references for RFC2616 to HTTPbis
75 - Added security considerations for International Strings and "PRECIS" support

76 - Clarified handling of PUT (& POST) with regards to mutability and default values

- Corrected version numbers in sec 3.11 API Versioning to v2 (from v1)
- Clarified that no filter matches should return success totalResults=0

Draft 07 - PH - Revisions regarding support of detailed errors (Tickets 37, 46, 67)

Draft 08 - PH - Revisions as follows

- Added clarification on schemas handling during PATCH operation
- Revised example URN in Attribute Notation section to comply with IANA namespace rules
- Fixed typo in ABNF, attrExpr should be attrExp
- Added more security considerations for HTTP and sensitive data
- Revised authentication and authorization sections for greater clarity.
- Replaced the word "search" with "query" for consistency
- Clarified sucessful resource creation response
- Added clarification on primary value handling in PATCH (consistent with draft 03)
- Revised SCIM Bulk error handling to conform with draft 07 error handling

Draft 09 - PH - Revisions as follows

- Aligned API with new URN namespace per RFC3553 and IETF90 meeting
- Clarified URN usage within patch (what schema urn applies)
- Made 'path' optional in PATCH for Add and Replace
Draft 10 - PH - Revisions as follows

Restructuring of Bulk into sub-sections

General clarifications

Improved Base URI section

Authorization section clarifications

Draft 11 - PH - Revisions as follows

Made mutability processing rules for CREATE more editorially obvious

Added clarifications and security considerations for Anonymous operations

Added clarifications to "/Me" for POST requests

Clarified use of bulkids with multiple requests

Corrected JSON parsing issue by adding "Operations" attribute to PATCH operation

Draft 12 - PH - Editorial NITs

Fix line lengths in artwork to be 72 chars or less

Remove unused references

Fix normative terms per RFC2119

Updated reference to draft-reschke-http-status-308 to RFC7238

Draft 13 - PH - Added clarification to error response for improperly formatted email/phonenumbers

Draft 14 - PH - Nits and clarifications

Added new Service Provider Discovery section that clarifies use of ResourceType, Schemas, and ServiceProviderConfigs

As Complex attributes cannot support sub-attributes that are complex, the filter ABNF was corrected to prevent nested valueFilters (which presumes support for nested Complex Attributes)
Corrections to ABNF: Added missing space (SP) values to logicExp ABNF rule. Corrected "not(" to make "not" optional.

Added additional filter example showing full path with schema URI (to disambiguate duplicate names between schemas)

Missing POST verb added to HTTP errors (table 7) since a POST endpoint might be undefined or NOT FOUND.

Corrected JSON example in sec 3.3.2.1 (removed extraneous ")

Corrected filter in Figure 3 so that multiple resource types can be returned per the response example in figure 4.

Clarifications and improvements to examples in PATCH replace operations

Updated references to saslprep and precis frameworks

Draft 15 - PH - Clarifications on returning "path" handling during PATCH "replace" operations. Updated references.

Draft 16 - PH - Clarification of SCIM protocol definitions of resources vs messages and general process rules regarding schema including validation.

Draft 17 - PH - Edits based on Gen-ART review

Draft 18 - PH - Edits based on IESG feedback

Clarified use of authentication schemes

Nits and wording clarifications

Corrected definitions of HTTP Status 401/403

Manager corrected in PATCH example operation (consistent with schema and examples)

Removed editor’s note regarding Service Provider unique error codes

Updated references to SCIM Core Schema and other documents.

Made capitalization of ‘client’ and ‘service provider’ terms consistent (lower case)
Add references to draft-ietf-oauth-assertions-18 and draft-ietf-httpauth-basicauth-update-07

Draft 19 - PH - IESG review

Corrections as per IESG review comments from Ben Campbell

Corrections as per IESG review comments from Stephen Farrell

Clarified that other media types may be supported

Corrected non-normative (statements of fact) use of ‘MAY’ to ‘may’.

Changed use of SHOULD use security considerations to MUST

Servers that do not support /Me corrected to return 501 instead of 403

Removed reference to wikipedia and order of operations

General edits to clarify awkward text and typos
