SS7 MTP3-User Adaptation Layer (M3UA) Management Information Base using SMIv2

<draft-ietf-sigtran-m3ua-mib-06.txt>

Status of This Memo

This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of RFC 2026. Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or cite them other than as "work in progress".

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/lid-abstracts.txt

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html.

This document is an individual submission to the IETF. Comments should be directed to the authors.

Abstract

The MTP3-User Adaptation Layer is a protocol for the transport of any SS7 MTP3-User signalling (e.g., ISUP and SCCP messages) over IP using the services of the Stream Control Transmission Protocol. Also, provision is made for protocol elements that enable a seamless operation of the MTP3-User peers in the SS7 and IP domains. This protocol would be used between a Signalling Gateway (SG) and a Media Gateway Controller (MGC) or IP-resident Database. It is assumed that the SG receives SS7 signaling over a standard SS7 interface using the SS7 Message Transfer Part (MTP) to provide transport.
This memo defines the Management Information Base (MIB) module, which describes the minimum amount of objects needed to manage the implementation of the M3UA.

Open Issues

- Remove this section.
- Remove Revision History
- Decide under which object identifier branch of the SNMP tree, M3UA will be placed (value obtained when submitted to the IETF editor).

1. Introduction

This memo defines the Management Information Base (MIB) module which describes managed objects for implementations of the M3UA.

The document starts with a brief description of the SNMP framework and continues with the MIB explanation and security consideration among others.

Terms related to the SCTP architecture are explained in [1]. Other specific abbreviations are listed below.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

1.1 Abbreviations

- AS     - Application Server
- ASP    - Application Server Process
- ASPM   - Application Server Process Management
- CIC    - Circuit Identification Code
- DPC    - Destination Point Code
- IPSP   - IP Server Process
- MIB    - Management Information Base
- M3UA   - SS7 MTP3-User Adaptation Layer
- NA     - Network Appearance
- NI     - Network Indicator
- OPC    - Originating Point Code
- PC     - Point Code
- SCTP   - Stream Control Transmission Protocol
- SG     - Signaling Gateway
- SGP    - Signaling Gateway Process
- SI     - Service Indicator
- SMI    - Structure of Management Information
- SNMP   - Simple Network Management Protocol
- SP     - Signaling Process
- SSN    - Sub-System Number

2. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].
Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

3. Structure of the MIB

The MIB is structured in the following way:

MIB-2 {1 3 6 1 2 1}
   |---(xxxx)m3uaMib
   |   |---(1) m3uaManagement
   |   |   |---(1) m3uaAttributes
   |   |   |   |---(1) m3uaConfig
   |   |   |   |---(2) m3uaStatistics
   |   |---(2) m3uaTables
   |---(2) m3uaConformance
   |   |---(1) m3uaGroups
   |   |---(2) m3uaCompliances
   |   |   |---(1) m3uaAspCompliance
   |   |   |---(2) m3uaSgpIpsspCompliance

where the following sections are described:

- m3uaManagement, where all the objects to manage M3UA are defined under this branch.
- m3uaAttributes: where general attributes values are placed. It is divided in:
  
  Â, m3uaConfig: where the general M3UA configuration parameters are listed.

  Â, m3uaStatistics: where general Statistics for M3UA are listed.

- m3uaTables: where specific attributes for each element that can be defined and used to manage a M3UA Based System. Every table is structured in the following way:

  m3uaScopeTablename
  |
  / \
  m3uaScopeCfg  m3uaScopeStat

These tables hold data for:

- Asp: Tables that are implemented in ASP Agents.

- SgpIpsp: Tables that are implemented in both SGP and IPSP Agents.

- Gen: Tables implemented in all ASP, SGP and IPSP Agents.

  o m3uaConformance, for the Unit of Conformance.

- m3uaGroups: M3UA MIB variables have been grouped according to their functionality and the context they belong to.

- m3uaCompliances: minimal list of objects in the M3UA MIB module that an agent developer must implement.

3.1 Management

3.1.1 Attributes

3.1.1.1 Protocol General Variables

The first section of the MIB contains the general variables of the M3UA protocol. Maximum, minimum and initial values can be found here.

3.1.1.2 Protocol General Statistics

Statistics included here relate to the whole M3UA layer. Statistics per association are defined inside specific association tables.
3.1.2 ASP Tables

All the tables included within this branch, are tables to be located in the ASP node. These tables will show remote (SGP) or local (ASP) nodes parameters.

The tables have been divided into Configuration Tables (Cfg) and Statistic Tables (Stat).

3.1.2.1 Destination Table

The destination table is composed of all the parameters needed to find the right SG to reach the SS7 destination. The addressing parameters that are needed are: Network Appearance (NA) that univocally reference the network where the message is sent, and Destination Point Code (DPC), which is the final address in the SS7 domain.

Each final destination within the SS7 domain can be reached through one or more Signaling Gateways (SGs). The state of the destination may be different for each SG and AS pairs.

The result of this table would be the final destination state. An SS7 node may be available, unavailable, congested, restricted or unknown. There may be certain cases where its state is unknown, e.g. after initialization.

  |   |   |   |   |   |   |   |
  +---(3) m3uaAspDestSgId (index)
```
3.1.2.2 Signaling Gateway Process Table

This table compiles the SGPs that serve a SG. An SGP may be only activated for certain ASes.

The result of the table is the status of the AS through a specific SGP.

```

3.1.2.3 Association Table
From an ASP point of view, an SGP can be reached using the association established to it. This table allows to know the identification for the association to a concrete SGP as well as the SCTP streams constraints imposed by M3UA to the lower layer.

3.1.2.4 Routing Context Table

The Routing Context (RC) is an optional parameter as per RFC3332. When this parameter is used by an M3UA implementation, this table will show the values that it takes.

RC scope is per SGP where each AS has an associated RC value.

Roque, et al  [Page 9]
3.1.2.5 ASP Statistics Table

It defines statistics specific to an Application Server Process.

Statistics applicable to SGP, ASP and IPSP are covered in the generic statistics table.
3.1.3 SGP/IPSP Tables

All the tables included within this branch are tables to be located in the SGP or IPSP node. These tables will show remote (ASP/IPSP) node parameters.

The tables have been divided into Configuration Tables (Cfg) and Statistics Tables (Stat).

3.1.3.1 Routing Table

The Routing table contains a list of routing keys, which translate to an Application Server ID and a corresponding Routing Context.

As a Routing Key may be composed of any combination of basic SS7 routing elements, if an element is not included in the routing key, a default value is assigned. This default value can continue being considered as an indexing value itself.
3.1.3.2 Application Server (AS) Table

The Application Server table contains information on the state and traffic mode of each Application for which one or more routing keys can exist in the Signalling Gateway or IPSP routing table.
### 3.1.3.3 Application Server Process (ASP) Table

This table shows the State of the Application Server Process or IPSP for each Application Server, and the role of the ASP in the AS traffic distribution, according to each AS traffic mode.

```
3.1.3.4 Application Server Process (ASP) Association Table

It defines data related to the SCTP Association for an Application Server Process or IPSP.

Further Association data can be obtained from the SCTP MIB.

3.1.3.5 SGP / IPSP Statistics Table

It defines statistics specific to a Signaling Gateway Process or IP Signaling Process.
Statistics applicable to SGP, ASP and IPSP are covered in the generic statistics table.

For the IPSP, the ASP Statistics table also applies.

The table contains statistics data related to the M3UA messages exchanged through each association at the SGP or IPSP.

5.2 Informative References

6. Security Considerations

There are a number of management objects defined in this MIB that have a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

It is thus important to control even GET access to these objects and possibly to encrypt the values of these objects when sending them over the network via SNMP. Not all versions of SNMP provide features for such a secure environment.

SNMPv1 by itself is not a secure environment. Even if security measures are taken (e.g., using IPSEC), there is no per-user control as to who (once an IPSEC association is established between hosts) is allowed to GET or SET the objects in this MIB.

It is recommended that the implementers consider the security features as provided by the SNMPv3 framework. Specifically, the use of the...

It is then a customer/user responsibility to ensure that the SNMP entity giving access to an instance of this MIB, is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

9. Revision History

9.1 Changes from draft rev 05 to draft rev 06:

- Load-sharing objects (m3uaSpLshMethod, m3uaStreamLshMethod) are removed since nothing is standardized about how to perform load-sharing.
9.2 Changes from draft rev 04 to draft rev 05:

- Changed objects from having writing permission to read-only.
- General MIBs boiler plate updated.
- Tables divided per node type: ASPs, SGP/IPSP and General Tables (with general values and statistic, valid per every node type).
- Updated contact information.
- Removed CIC and SSN from the RK.
- Security Considerations updated.
- Copyright Statement included.

9.3 Changes from draft rev 03 to draft rev 04:

- Integer32 is imported but not used. Removed.
- TEXTUAL-CONVENTION is imported but not used. Removed.
- mib-2 suggested as branch for mib.
- m3uaAppSpEpState consistently defined as INTEGER.
- m3uaPeerAppTrafficMode consistently defined as INTEGER.
- Fixed error in m3uaSpEpEntry object description text.
- Rework in m3uaAppType object description text.

9.4 Changes from draft rev 02 to draft rev 03:

- Value range of m3uaAppTrafficMode object is modified.
- Object m3uaLocalPort is changed to "read-write". A comment is added with the recommended IANA port number.
o Object m3uaFailOverBuffering is deleted. A comment in object m3uaTrValue is added: If Tr is 0 then FailOver Buffering is Off. Thus, there is no further need for this element.

o Object m3uaMaxPeerApplications is deleted.

o Object m3uaMaxSPperApplications is deleted.

o Object m3uaAppType is added to Logical Application Table.

o Replace "Sent" by "out" and "Received" by "in" in statistics.

o Object m3uaSSN is deleted from Routing Table.

o Object m3uaNI is deleted from Routing Table.

o Object m3uaPeerAppTrafficMode is added to Routing Table.

o Index m3uaAppId in SP Endpoint Statistic Table is removed.

o Signaling Process Table replaced by Application-Endpoint Table.

o Index m3uaSpEpAssocId in SP Endpoint Table is removed.

o Index m3uaSpEpassocId in Local and Remote IP address table is replaced by m3uaSpEpId.

o Added new Lookup Reverse Tables for:
  - Get EndPoint Id from Association Id.
  - Get Routing Key Id from Application Id.
  - Get Routing Key Id from DPC and NA.
  - Get Endpoints serving an Application.

o Routing Table has been restructured to deal with multiplicity of SIs, OPCs and CIC Ranges per Routing Key. Three new subtables are used.

9.5 Changes from draft rev 01 to draft rev 02:

o Section 3.1.2.3 Signaling Process Table - Chapter re-phrased.

o Section 3.1.2.4 Signaling Process Endpoint Table - Last paragraph removed.

o Section 3.1.2.5 Signaling Process Endpoint Statistics Table m3uaAppId and m3uaSpEpId added to the table figure
Corresponding changes in Definitions chapter applied.
Section 3.1.2.6 Network Appearance Table
Fixed Duplicate Section No.
m3uaNaRowStatus added to table figure.
Corresponding changes in Definitions chapter applied.

Object definition of m3uaMaxStreamInbound is removed.

Object Definition of m3uaSpEpEntry
Index "m3uaAppId" is replaced by m3uaSpEpAssocId.

Object Definition of m3uaSpEpStatRowStatus
Definition is deleted.

9.6 Changes due to the alignment with the RFC2851 update.

Include clarification text of the IP address types supported in the M3UA MIB. Chapter 3.1.2.7.2 (Local and Remote IP address table)

Remote Primary IP address: Addition of the ipv4z an ipv6z types for non-globally IP addresses in which a scope identifier is needed. Addition of the scope of ipv6 type. All of them according to the RFC2851update-v04

InetAddressType for local and remote IP addresses:
Limit UNKNOWN type only for unknown IP address format. Remove UNKNOWN type for zero-length value in the InetAddress since it will be never zero-length due to the size restriction (0..64)

Addition of the ipv4z an ipv6z types for non-globally IP addresses in which a scope identifier is needed. Addition of the scope of ipv6 type. All of them according to the RFC2851update-v04

Conformance:
Description: Specify that the M3UA MIB only need to support IPv4/IPv6 addresses without a zone index, unknown type and DNS names. Support for IPv4/IPv6 addresses without zone indices is not required.

InetAddressType of local and remote IP address: Clarify the implementation is only required to support IPv4 and IPv6 address types without zone indices. Clarify also that UNKNOWN type is only used in case of local and remote addresses when invalid/unknown IP address format.
