Abstract

This document defines a YANG data model for the configuration and operations (state, notification, RPC etc.) of IPv4-in-IPv6 Softwire Border Routers and Customer Premises Equipment. The model covers the Lightweight 4over6, MAP-E and MAP-T Softwire mechanisms.

Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on May 4, 2017.

1. Introduction

The IETF Softwire Working Group has developed several IPv4-in-IPv6 Softwire mechanisms to address various deployment contexts and constraints. As a companion to the architectural specification documents, this document focuses on the provisioning of A+P softwire functional elements: Border Routers (BRs) and Customer Premises Equipment (CEs).
This document defines a YANG data model [RFC6020] that can be used to configure and manage A+P Softwire elements using the NETCONF protocol [RFC6241]. A DS-Lite YANG data model is defined in [I-D.ietf-softwire-dslite-yang].

The Softwire YANG model is structured into two sub-models:

- Lightweight 4over6 [RFC7596]
- MAP-E [RFC7597] and MAP-T [RFC7599] (combined due to their common configuration parameters).

Two root containers are defined:

1. Container "softwire-config" holds the collection of YANG definitions common to all Softwire element configuration.
2. Container "softwire-state" holds YANG definitions for the operational state of the Softwire elements.

A NETCONF notify module is also included.

This approach has been taken so that the model can be easily extended to support additional Softwire mechanisms, if required.

1.1. Terminology

The reader should be familiar with the concepts and terms defined in [RFC7596], [RFC7597], [RFC7599], and the YANG data modelling language [RFC6020].

1.2. Tree Diagrams

The meaning of the symbols in these diagrams are as follows:

- Brackets "[" and "]" enclose list keys.
- Braces "{" and "}" enclose feature content.
- Parentheses "(" and ")" enclose choice and case nodes, and case nodes are also marked with a colon (":")
- Symbols after data node names: "?" means an optional node, and "*" denotes a list and leaf-list.
- Abbreviations before data node names: "rw" means configuration data (read-write), and "ro" means state data (read-only).
1.3. YANG Modelling of NAT44 Functionality

The model does not include CPE NAT-specific provisioning parameters that may be used for IPv4 address sharing other than the external IP address and port set which a softwire client may use for NAT44. NAT-specific considerations are out of scope of this document. A YANG model for the configuration and management of NAT gateways is described in [I-D.sivakumar-yang-nat].

2. Common

The following sections of the document are structured with the root of the Softwire YANG model (common to all mechanisms) described first. Subsequent sections describe the models relevant to the different softwire mechanisms. All functions are listed, but the YANG models use the "feature" statement to distinguish among the different softwire mechanisms. This document defines a new module named "ietf-softwire" for Softwire data models such that this module augments "ietf-ipv6-unicast-routing" module that is defined in [I-D.ietf-netmod-routing-cfg].

3. Lightweight 4over6

Lightweight 4over6 (binding) includes two elements: lwAFTR (BR) and lwB4 (CE). The lwAFTR holds configuration for IPv4-IPv6 address bindings which are used for the forwarding of traffic originating from lwB4s.

The lwB4 is configured with the relevant parameters for establishing the IPv4-in-IPv6 tunnel including an IPv6 address for the lwAFTR and the IPv4 configuration for NAT44.

4. MAP-E and MAP-T

MAP-E and MAP-T elements are provisioned with the MAP rules necessary for defining MAP domains and forwarding rules. For MAP-T CEs, an additional "ipv6-prefix" parameter is also included. Note that when referring to MAP-E/T (algorithm), the CE and BR shares the same model for configuration and management.

5. Softwire YANG Tree Diagrams

5.1. Common Tree Diagrams

Figure 1 describes the high level softwire YANG data model and the way tree is organized is common to all of the different softwire mechanisms listed in Section 1:
++-rw softwire-config
  +--rw description?               string
  +--rw binding {binding}?        string
     |  +--rw br {br}?
     |     +--rw enable?                          boolean
     |     +--rw br-instances
     |        +--rw br-instance* [id]
     |           +--rw binding-table-versioning
     |              |  +--rw binding-table-version?  uint64
     |              |  +--rw binding-table-date? yang:date-and-time
     |              +--rw id                         uint32
     |     +--rw name?                      string
     +--rw ce {ce}?

Figure 1: High Level Softwire YANG Tree Organization

5.2. Lightweight 4over6 Tree Diagrams

Figure 2 defines the softwire data model for lw4o6 (softwire binding mode) which includes lwAFTR (BR) and lwB4 (CE):

module: ietf-softwire
  +-rw softwire-config
    +--...
    +--rw binding {binding}?
      +--rw br {br}?
        +--rw enable?                          boolean
        +--rw br-instances
        |  +--rw br-instance* [id]
        |     +--rw binding-table-versioning
        |        |  +--rw binding-table-version?  uint64
        |        |  +--rw binding-table-date? yang:date-and-time
        |        +--rw id                         uint32
        |     +--rw name?                      string
        +--rw ce {ce}?
Figure 2: Softwire Lightweight 4over6 Data Model Tree Structure
The data model assumes that each CE/BR instance can: be enable/disabled, be provisioned with a dedicated configuration data, and maintain its own binding table.

Additional information on some of the important lwAFTR nodes is provided below:

- binding-table-versioning: optionally used to add an incremental version number and/or timestamp to the binding table. This can be used for logging/data retention purposes. The version number is incremented and a new timestamp value written whenever a change is made to the contents of the binding table or a new binding table list is created.

- binding-entry: used to define the binding relationship between 3-tuples, which contains the lwB4’s IPv6 address/prefix, the allocated IPv4 address and restricted port-set. For detail information, please refer to [RFC7596].

- tunnel-payload-mtu: used to set the IPv4 MTU for the lw4o6 tunnel.

- tunnel-path-mru: used to set the maximum lw4o6 IPv6 encapsulating packet size that can be received.

- psid-offset: used to set the number of offset bits.

- psid-len: defines the number of ports that will be allocated for the softwire.

- psid: used to identify the set of ports allocated for a specific softwire.

- tunnel-num-threshold: used to set the maximum number of tunnels that can be created on the lw4o6 device simultaneously.

- active-tunnel-num (ro): used to present the number of tunnels currently provisioned on the device.

- active (ro): used to show the status of particular binding-entry.

Additional information on some of the important lwB4 nodes is provided below:

- b4-ipv6-addr-format: indicates the format of lwB4 IPv6 address. If set to true, the IPv6 source address of the lwB4 is constructed according to the description in Section 6 of [RFC7597]; if set to false, the lwB4 can use any valid /128 address from an assigned IPv6 prefix.
o binding-ipv6info: used to set the IPv6 address type which is combined in a binding entry, for a complete address or a prefix.

5.3. MAP-E and MAP-T Tree Diagrams

Figure 3 defines the softwire data model for MAP-E and MAP-T:

```yang
module: ietf-softwire
  +--rw softwire-config
  |  +--...
  |  +--rw algorithm (algorithm)? boolean
  |  +--rw enable? boolean
  |  +--rw algo-algorithm
  |     +--rw algo-instance* [id]
  |        +--rw algo-versioning
  |        |  +--rw algo-version? uint64
  |        |  +--rw algo-date? yang:date-and-time
  |        +--rw id uint32
  |        +--rw name? string
  |        +--rw data-plane enumeration
  |        +--rw ea-len uint8
  |        +--rw rule-ipv6-prefix inet:ipv6-prefix
  |        +--rw rule-ipv4-prefix inet:ipv4-prefix
  |        +--rw forwarding boolean
  |        +--rw psid-offset uint8
  |        +--rw psid-len uint8
  |        +--rw tunnel-payload-mtu uint16
  |        +--rw tunnel-path-mtu uint16
  |        +--rw br-ipv6-addr inet:ipv6-address
  |        +--rw dmr-ipv6-addr inet:ipv6-prefix
  +--ro softwire-state
     +--...
     +--ro algorithm (algorithm)?
     +--ro algo-instances
     |  +--ro algo-instance* [id]
     |     +--ro id int32
     |     +--ro name? string
     |     +--ro sentPacket? yang:zero-based-counter64
     |     +--ro sentByte? yang:zero-based-counter64
     |     +--ro rcvdPacket? yang:zero-based-counter64
     |     +--ro rcvdByte? yang:zero-based-counter64
     |     +--ro droppedPacket? yang:zero-based-counter64
     |     +--ro droppedByte? yang:zero-based-counter64

Figure 3: Softwire MAP-E and MAP-T Data Model Structure
```

Additional information on some of the important MAP-E and MAP-T nodes is provided below:

o  algo-versioning: optionally used to add a incremental version number and/or timestamp to the algorithm. This can be used for logging/data retention purposes. The version number is incremented and a new timestamp value written whenever a change is made to the algorithm or a new instance is created.

o  forwarding: specifies whether the rule can be used as a Forward Mapping Rule (FMR). If not set, this rule is a Basic Mapping Rule (BMR) only and must not be used for forwarding. See Section 4.1 of [RFC7598].

o  ea-len: used to set the length of the Embedded-Address (EA), which defined in the mapping rule for a MAP domain.

o  dmr-ipv6-prefix: defines the Default Mapping Rule (DMR) for MAP-T. This parameter is optional when configuring a MAP-T BR.

o  stat-count (ro): use to show the numbers of packets and bytes information of specific device respectively.

5.4. Notifications for Softwire YANG

This section describes the tree structure for notifications. These notifications pertain to the configuration and monitoring portions of the specific Softwire mechanisms. The logic is that the softwire instance notifies the NETCONF client with the index for a mapping entry and the NETCONF client retrieves the related information from the operational datastore of that instance.

module: ietf-softwire
notifications:
  +++-n softwire-binding-br-event {binding,br}?
    |  +++-ro br-id? -> /softwire-state/binding/br/.../id
    |  +++-ro invalid-entry* -> /softwire-config/binding/br/.../binding-table/binding-entry/binding-ipv6info
    |  +++-ro added-entry* inet:ipv6-address
    |  +++-ro modified-entry* -> /softwire-config/binding/br/.../binding-table/binding-entry/binding-ipv6info
  +++-n softwire-binding-ce-event {binding,ce}?
    |  +++-ro ce-binding-ipv6-addr-change inet:ipv6-address
  +++-n softwire-algorithm-instance-event {algorithm}?
    |  +++-ro algo-id -> /softwire-config/algorithmg/.../id
    |  +++-ro invalid-entry* -> /softwire-config/algorithmg/.../id
    |  +++-ro added-entry* -> /softwire-config/algorithmg/.../id
    |  +++-ro modified-entry* -> /softwire-config/algorithmg/.../id

Figure 4: Softwire Notifications Data Model Structure

Additional information on some of the important notification nodes is listed below:
invalid-entry, added-entry, modified-entry: used to notify the client that a specific binding entry or MAP rule is expired or invalidated, added, or modified.

ce-binding-ipv6-addr-change: used to notify that the lwB4’s binding-ipv6-address has been changed or the value of the ‘b4-ipv6-addr-format’ is "False".

6. Softwire YANG Model

This module imports typedefs from [RFC6991].

/*
* Features
*/

feature binding {
description
"Lightweight 4over6 (binding) is an IPv4-over-IPv6 tunnelling transition mechanism. Lightweight 4over6 is a solution designed specifically for complete independence between IPv6 subnet
prefix (and /128 IPv6 address) and IPv4 address with or without IPv4 address sharing.

This is accomplished by maintaining state for each softwire (per-subscriber state) in the central lwAFTR and a hub-and-spoke forwarding architecture. In order to delegate the NAPT function and achieve IPv4 address sharing, port-restricted IPv4 addresses needs to be allocated to CEs.

Besides lw4o6, this feature also covers MAP in 1:1 mode (using offset=0, PSID explicitly defined);

reference
"RFC7596";
}

feature br {
  if-feature binding;
  description
  "The AFTR for Lightweight 4over6, so-called lwAFTR (BR). This feature indicates that a instance functions as a lwAFTR (BR). A lwAFTR (BR) is an IPv4-in-IPv6 tunnel concentrator that maintains per-subscriber IPv4-IPv6 address binding.";
}

feature ce {
  if-feature binding;
  description
  "The B4 for Lightweight 4over6, so-called lwB4 (CE). This feature indicates that a instance functions as a lwB4 (CE). A lwB4 (ce) is an IPv4-in-IPv6 tunnel initiator. It is dual-stack capable node, either a directly connected end-host or a CE. It sources IPv4 connections using the configured port-set and the public IPv4 address.";
}

feature algorithm {
  description
  "MAP-E is an IPv6 transition mechanism for transporting IPv4 packets across an IPv6 network using IP encapsulation. MAP-E allows for a reduction of the amount of centralized state using rules to express IPv4/IPv6 address mappings. This introduces an algorithmic relationship between the IPv6 subnet and IPv4 address. The Mapping of Address and Port - Translation (MAP-T) architecture is a double stateless NAT64 based solution. It uses the stateless algorithmic address & transport layer port mapping scheme defined in MAP-E. The MAP-T solution differs from MAP-E in
the use of IPv4-IPv6 translation, rather than encapsulation, as
the form of IPv6 domain transport.
This feature indicates the instance functions as a MAP-E or
MAP-T instance.

7. Configuration Example for a lw4o6 Binding-Table

The lwAFTR maintains an address binding table which contains the following 3-tuples:

- IPv6 Address for a single lwB4
- Public IPv4 Address
- Restricted port-set

The entry has two functions: the IPv6 encapsulation of inbound IPv4 packets destined to the lwB4 and the validation of outbound IPv4-in-IPv6 packets received from the lwB4 for de-capsulation.

Consider an example to add an entry that maintains the relationship between 3-tuples of lwB4 (2001:db8::1), '192.0.2.1' and '1234' in the binding table of the lwAFTR (2001:db8::2). Here is the example binding-table configuration xml:
<rpc message-id="101"
    xmlns:nc="urn:params:xml:ns:yang:ietf-softwire:1.0">
    <!-- replace with IANA namespace when assigned. -->
    <edit-config>
        <target>
            <running/>
        </target>
        <softwire-config>
            <lw4o6-aftr>
                <lw4o6-aftr-instances>
                    <lw4o6-aftr-instance>
                        <aftr-ipv6-addr>2001:db8::2</aftr-ipv6-addr>
                        <binding-table>
                            <binding-entry>
                                <binding-ipv4-addr>192.0.2.1</binding-ipv4-addr>
                                <port-set>
                                    <psid>1234</psid>
                                </port-set>
                                <binding-ipv6-addr>2001:db8::1</binding-ipv6-addr>
                                <active>1</active>
                            </binding-entry>
                        </binding-table>
                    </lw4o6-aftr-instance>
                </lw4o6-aftr-instances>
            </lw4o6-aftr>
        </softwire-config>
    </edit-config>
</rpc>

Figure 5: lw4o6 Binding-Table Configuration XML

7.1. Configuration Example for a MAP-E BR

A MAP-E BR is configured with forward mapping rules for the clients it is serving. In this example (taken from [RFC7597], Appendix A, Example 2), the following parameters are required:

- Rule IPv6 Prefix
- Rule IPv4 Prefix
- Rule EA-bit bit length
- IPv6 Address of MAP-BR

The mapping rule has two functions: identifying the destination CE IPv6 address for encapsulating inbound IPv4 packets and the validation of outbound IPv4-in-IPv6 packets received from the CE for de-capapsulation.
The transport type for the data plane also needs to be configured for encapsulation to enable MAP-E and forwarding needs to be enabled.

Consider an example for the following MAP-E Forwarding Mapping Rule:

Data plane: encapsulation

Rule IPv6 Prefix: 2001:db8::/40
Rule IPv4 Prefix: 192.0.2.0/24
Rule EA-bit Length: 16
BR IPv6 Address: 2001:db8:ffff::1

Here is the example MAP-E BR configuration xml:

```xml
<rpc message-id="101"
     xmlns:nc="urn:params:xml:ns:yang:ietf-softwire:1.0">
  <!-- replace with IANA namespace when assigned. -->
  <edit-config>
    <target>
      <running/>
    </target>
    <softwire-config>
      <algorithm>
        <algo-instance>
          <data-plane>encapsulation</data-plane>
          <ea-len>16</ea-len>
          <rule-ipv6-prefix>2001:db8::/40</rule-ipv6-prefix>
          <rule-ipv4-prefix>192.0.2.0/24</rule-ipv4-prefix>
          <forwarding>1</forwarding>
          <br-ipv6-addr>2001:db8:ffff::1</br-ipv6-addr>
        </algo-instance>
      </algorithm>
    </softwire-config>
  </edit-config>
</rpc>
```

Figure 6: MAP-E FMR Configuration XML

8. Security Considerations

The YANG module defined in this memo is designed to be accessed via the NETCONF protocol [RFC6241]. The lowest NETCONF layer is the secure transport layer and the mandatory to implement secure transport is SSH [RFC6242]. The NETCONF access control model [RFC6536] provides the means to restrict access for particular NETCONF users to a pre-configured subset of all available NETCONF protocol operations and content.
All data nodes defined in the YANG module which can be created, modified and deleted (i.e., config true, which is the default). These data nodes are considered sensitive. Write operations (e.g., edit-config) applied to these data nodes without proper protection can negatively affect network operations.

9. IANA Considerations

This document requests IANA to register the following URI in the "IETF XML Registry" [RFC3688].

    Registrant Contact: The IESG.
    XML: N/A; the requested URI is an XML namespace.

This document requests IANA to register the following YANG module in the "YANG Module Names" registry [RFC6020].

    name: ietf-softwire
    prefix: softwire
    reference: RFC XXXX

10. Acknowledgements

The authors would like to thank Lishan Li, Bert Wijnen, Giles Heron, and Ole Troan for their contributions to this work.
