A YANG Data Model for Resource Reservation Protocol (RSVP)  
draft-ietf-teas-yang-rsvp-11

Abstract

This document defines a YANG data model for the configuration and management of RSVP Protocol. The model covers the building blocks of the RSVP protocol that can be augmented and used by other RSVP extension models such as RSVP extensions to Traffic-Engineering (RSVP-TE). The model covers the configuration, operational state, remote procedure calls, and event notifications data.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 5, 2020.

1. Introduction

YANG [RFC6020] is a data definition language that was introduced to define the contents of a conceptual data store that allows networked devices to be managed using NETCONF [RFC6241]. YANG is proving relevant beyond its initial confines, as bindings to other interfaces (e.g. ReST) and encoding other than XML (e.g. JSON) are being defined. Furthermore, YANG data models can be used as the basis of implementation for other interfaces, such as CLI and programmatic APIs.

This document defines a YANG data model that can be used to configure and manage the RSVP protocol [RFC2205]. This model covers RSVP protocol building blocks that can be augmented and used by other RSVP extension models—such as for signaling RSVP-TE MPLS (or other technology specific) Label Switched Paths (LSP)s.
1.1. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

The terminology for describing YANG data models is found in [RFC7950].

1.2. Model Tree Diagram

A full tree diagram of the module(s) defined in this document is given in subsequent sections as per the syntax defined in [RFC8340].

1.3. Prefixes in Data Node Names

In this document, names of data nodes and other data model objects are prefixed using the standard prefix associated with the corresponding YANG imported modules, as shown in Table 1.

<table>

</tr>
</tbody>
</table>

Table 1: Prefixes and corresponding YANG modules

2. Model Overview

The RSVP base YANG module augments the "control-plane-protocol" list in ietf-routing [RFC8349] module with specific RSVP parameters in an "rsvp" container. It also defines an extension identity "rsvp" of base "rt:routing-protocol" to identify the RSVP protocol.

The augmentation of the RSVP model by other models (e.g. RSVP-TE for MPLS or other technologies) are outside the scope of this document and are discussed in separate document(s), e.g. [I-D.ietf-teas-yang-rsvp-te].
2.1. Module(s) Relationship

This document divides the RSVP model into two modules: base and extended RSVP modules. Some RSVP features are categorized as core to the function of the protocol and are supported by most vendors claiming the support for RSVP protocol. Such features configuration and state are grouped in the RSVP base module.

Other extended RSVP features are categorized as either optional or providing ability to better tune the basic functionality of the RSVP protocol. The support for extended RSVP features by all vendors is considered optional. Such features are grouped in a separate RSVP extended module.

The relationship between the base and extended RSVP YANG model and the IETF routing YANG model is shown in Figure 1.

```
+--------------+
| Routing      |
| ietf-routing |
+--------------+
    |          |
    +---------+
    | RSVP module |
    | ietf-rsvp |
    +---------+
        |          |
        +---------+
        | Extended |
        | ietf-rsvp-extended |
        +-------------------+
            |                    |
            | o: augment relationship |
```

Figure 1: Relationship of RSVP and RSVP extended modules with other protocol modules

2.2. Design Considerations

The RSVP base model does not aim to be feature complete. The primary intent is to cover a set of standard core features that are commonly in use. For example:

- Authentication ([RFC2747])
- Refresh Reduction ([RFC2961])
- Hellos ([RFC3209])
- Graceful Restart ([RFC3473], [RFC5063])
The extended RSVP YANG model covers the configuration for optional features that are not must for basic RSVP protocol operation.

The defined data model supports configuration inheritance for neighbors, and interfaces. Data elements defined in the main container (e.g. the container that encompasses the list of interfaces, or neighbors) are assumed to apply equally to all elements of the list, unless overridden explicitly for a certain element (e.g. interface). Vendors are expected to augment the above container(s) to provide the list of inheritance command for their implementations.

2.3. Model Notifications

Notifications data modeling is key in any defined data model.

[I-D.ietf-netconf-subscribed-notifications] and [I-D.ietf-netconf-yang-push] define a subscription and push mechanism for YANG datastores. This mechanism currently allows the user to:

- Subscribe notifications on a per client basis
- Specify subtree filters or xpath filters so that only interested contents will be sent.
- Specify either periodic or on-demand notifications.

2.4. RSVP Base YANG Model

The RSVP base YANG data model defines the container "rsvp" as the top level container in this data model. The presence of this container enables the RSVP protocol functionality.

The derived state data is contained in "read-only" nodes directly under the intended object as shown in Figure 2.
module: ietf-rsvp
   +--rw rsvp!
      +--rw globals
         .
      +--rw interfaces
         .
         +-- ro <<derived state associated with interfaces>>
         .
      +--rw neighbors
         .
         +-- ro <<derived state associated with the tunnel>>
         .
      +--rw sessions
         .
         +-- ro <<derived state associated with the tunnel>>
         .
rpcs:
   +--x clear-session
   +--x clear-neighbor

Figure 2: RSVP high-level tree model view

Configuration and state data are grouped to those applicable on per node (global), per interface, per neighbor, or per session.

Global Data:

The global data cover the configuration and state that is applicable the RSVP protocol behavior.

Interface Data:

The interface data configuration and state model relevant attributes applicable to one or all RSVP interfaces. Any data or state at the "interfaces" container level is equally applicable to all interfaces - unless overridden by explicit configuration or state under a specific interface.

Neighbor Data:

The neighbor data cover configuration and state relevant to RSVP neighbors. Neighbors can be dynamically discovered using RSVP signaling or explicitly configured.
Session Data:

The sessions data branch covers configuration and state relevant to RSVP sessions. This is usually derived state that is result of signaling. This model defines attributes related to IP RSVP sessions as defined in [RFC2205].

2.4.1. Tree Diagram

Figure 3 shows the YANG tree representation for configuration and state data that is augmenting the RSVP basic module:

```yang

2.4.2. YANG Module

The ietf-rsvp module imports from the following modules:

- ietf-interfaces defined in [RFC8343]
- ietf-yang-types and ietf-inet-types defined in [RFC6991]
- ietf-routing defined in [RFC8349]
- ietf-key-chain defined in [RFC8177]

2.5. RSVP Extended YANG Model

The RSVP extended YANG model covers non-core RSVP feature(s). It also covers feature(s) that are not necessarily supported by all vendors, and hence, can be guarded with "if-feature" checks.

2.5.1. Tree Diagram

Figure 4 shows the YANG tree representation for configuration and state data that is augmenting the RSVP extended module:

module: ietf-rsvp-extended
  augment /rt:control-plane-protocols
    /rsvp:globals
      /rsvp:graceful-restart:
        ++rw restart-time?  uint32
        ++rw recovery-time?  uint32
      augment /rt:control-plane-protocols
        /rsvp:globals
/rsvp:statistics/rsvp:packets:
  +--ro discontinuity-time?  yang:date-and-time

Figure 4: RSVP extended model tree diagram

2.5.2. YANG Module

The ietf-rsvp-extended module imports from the following modules:

- ietf-rsvp defined in this document
- ietf-routing defined in [RFC8349]
- ietf-yang-types and ietf-inet-types defined in [RFC6991]
- ietf-key-chain defined in [RFC8177]

Figure 5 shows the RSVP extended YANG module:

```yaml
code begins
module ietf-rsvp-extended {
    yang-version 1.1;
    prefix "rsvp-ext";
}
```
import ietf-rsvp {
  prefix "rsvp";
  reference
    "RFCXXXX: A YANG Data Model for Resource Reservation Protocol (RSVP)";
}

import ietf-routing {
  prefix "rt";
  reference
    "RFC8349: A YANG Data Model for Routing Management (NMDA Version)";
}

import ietf-yang-types {
  prefix "yang";
  reference "RFC6991: Common YANG Data Types";
}

import ietf-key-chain {
  prefix "key-chain";
  reference "RFC8177: YANG Data Model for Key Chains";
}

3. IANA Considerations

This document registers the following URIs in the IETF XML registry
[RFC3688]. Following the format in [RFC3688], the following
registration is requested to be made.

XML: N/A, the requested URI is an XML namespace.

XML: N/A, the requested URI is an XML namespace.

This document registers two YANG modules in the YANG Module Names
registry [RFC6020].

name:       ietf-rsvp
prefix:     ietf-rsvp
reference:  RFCXXXX

name:       ietf-rsvp-extended
prefix:     ietf-rsvp-extended
reference:  RFCXXXX
4. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The Network Configuration Access Control Model (NACM) [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in the YANG module which are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., <edit-config>) to these data nodes without proper protection can have a negative effect on network operations.

/rt:routing/rt:control-plane-protocols/rt:control-plane-protocol/rsvp:

The presence of this container enables the RSVP protocol functionality on a device. It also controls the configuration settings on data nodes pertaining to RSVP sessions, interfaces and neighbors. All of which are considered sensitive and if access to either of these is compromised, it can result in temporary network outages or be employed to mount DoS attacks.

For RSVP authentication, the configuration supported is via the specification of key-chains [RFC8177] or the direct specification of key and authentication algorithm, and hence security considerations of [RFC8177] are inherited. This includes the considerations with respect to the local storage and handling of authentication keys.

Some of the RPC operations defined in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. The RSVP YANG module supports the "clear-session" and "clear-neighbor" RPCs. If access to either of these is compromised, they can result in temporary network outages be employed to mount DoS attacks.

The security considerations spelled out in the YANG 1.1 specification [RFC7950] apply for this document as well.
5. Acknowledgement

The authors would like to thank Lou Berger for reviewing and providing valuable feedback on this document.
