This document defines a YANG data model for the configuration and management of Multiprotocol Label Switching (MPLS) Traffic Engineering (TE) tunnels, Label Switched Paths (LSPs) and interfaces. The model augments the TE generic YANG model for MPLS packet dataplane technology.

This model covers data for configuration, operational state, remote procedural calls, and event notifications.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on May 5, 2020.
1. Introduction

YANG [RFC6020] and [RFC7950] is a data modeling language used to define the contents of a conceptual data store that allows networked devices to be managed using NETCONF [RFC6241]. YANG has proved relevant beyond its initial confines, as bindings to other interfaces (e.g. RESTCONF [RFC8040]) and encoding other than XML (e.g. JSON) are being defined. Furthermore, YANG data models can be used as the basis of implementation for other interfaces, such as CLI and programmatic APIs.

This document describes the YANG data model for configuration and management of MPLS TE tunnels, LSPs, and interfaces. Other YANG module(s) that model the establishment of MPLS LSP(s) via signaling protocols such as RSVP-TE ([RFC3209], [RFC3473]) are described in separate document(s).
1.1. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

The terminology for describing YANG data models is found in [RFC7950].

1.2. Prefixes in Data Node Names

In this document, names of data nodes and other data model objects are prefixed using the standard prefix associated with the corresponding YANG imported modules, as shown in Table 1.

Table 1: Prefixes and corresponding YANG modules

1.3. Acronyms and Abbreviations

MPLS: Multiprotocol Label Switching LSP: Label Switched Path LSR: Label Switching Router LER: Label Edge Router TE: Traffic Engineering

2. MPLS TE YANG Model

The MPLS TE YANG model covers the configuration, state, RPC and notifications data pertaining to MPLS TE interfaces, tunnels and LSPs parameters. The data specific to the signaling protocol used to establish MPLS LSP(s) is outside the scope of this document and is covered in other documents, e.g. in [I-D.ietf-teas-yang-rsvp] and [I-D.ietf-teas-yang-rsvp-te].
2.1. Module(s) Relationship

The MPLS TE YANG module "ietf-te-mpls" imports the following modules:

- ietf-te and ietf-te-device defined in [I-D.ietf-teas-yang-te]
- ietf-te-types and ietf-te-packet-types defined in [I-D.ietf-teas-yang-te-types]
- ietf-routing-types defined in [RFC8294]
- ietf-mpls-static defined in [I-D.ietf-mpls-static-yang]

![Diagram of Module Relationships]

Figure 1: Relationship of MPLS TE module with TE generic and RSVP-TE YANG modules

The MPLS TE YANG module "ietf-te-mpls" augments the "ietf-te" TE generic YANG module as shown in Figure 1.

2.2. Model Tree Diagram

Figure 2 shows the tree diagram of the MPLS TE YANG model that is defined in ietf-te-mpls.yang.

Figure 3: TE generic YANG module

3. IANA Considerations

This document registers the following URIs in the IETF XML registry [RFC3688]. Following the format in [RFC3688], the following 
registration is requested to be made.

XML: N/A, the requested URI is an XML namespace.

This document registers a YANG module in the YANG Module Names registry [RFC6020].

name: ietf-te-mpls
prefix: ietf-te-mpls
reference: RFC3209

4. Security Considerations

The YANG module defined in this memo is designed to be accessed via the NETCONF protocol [RFC6241]. The lowest NETCONF layer is the secure transport layer and the mandatory-to-implement secure transport is SSH [RFC6242]. The NETCONF access control model [RFC8341] provides means to restrict access for particular NETCONF users to a pre-configured subset of all available NETCONF protocol operations and content.

A number of data nodes defined in this YANG module are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., <edit-config>) to these data nodes without proper protection can have a negative effect on MPLS network operations. Following are the subtrees and data nodes and their sensitivity/vulnerability:

"/te/tunnels": The augmentation to this list specifies configuration to TE tunnels on a device. Unauthorized access to this list could cause the device to ignore packets it should receive and process.

"/te/globals": The augmentation to this target specifies configuration applicable to the to all or one TE device. Unauthorized access to this list could cause the device to ignore packets it should receive and process.
