Traffic Engineering Common YANG Types
draft-ietf-teas-yang-te-types-02

Abstract

This document defines a collection of common data types and groupings in YANG data modeling language. These derived common types and groupings are intended to be imported by modules that model Traffic Engineering (TE) configuration and state capabilities.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on June 24, 2019.

1. Introduction

YANG [RFC6020] and [RFC7950] is a data modeling language used to model configuration data, state data, Remote Procedure Calls, and notifications for network management protocols such as NETCONF [RFC6241]. The YANG language supports a small set of built-in data types and provides mechanisms to derive other types from the built-in types.

This document introduces a collection of common data types derived from the built-in YANG data types. The derived types and groupings are designed to be the common types applicable for modeling Traffic Engineering (TE) features, e.g. in models defined in [I-D.ietf-teas-yang-te], [I-D.ietf-teas-yang-te-topo] and [I-D.ietf-teas-yang-rsvp]).

1.1. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP
14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

The terminology for describing YANG data models is found in [RFC7950].

1.2. Prefixes in Data Node Names

In this document, names of data nodes and other data model objects are prefixed using the standard prefix associated with the corresponding YANG imported modules, as shown in Table 1.

Table 1: Prefixes and corresponding YANG modules

2. Acronyms and Abbreviations

GMPLS: Generalized Multiprotocol Label Switching
LSP: Label Switched Path
LSR: Label Switching Router
LER: Label Edge Router
MPLS: Multiprotocol Label Switching
RSVP: Resource Reservation Protocol
TE: Traffic Engineering
DS-TE: Differentiated Services Traffic Engineering
SRLG: Shared Link Risk Group
3. Overview

This document defines two YANG modules for common TE types: ietf-te-types for TE generic types and ietf-te-mpls-types for MPLS technology specific types. Other technology specific TE types are outside the scope of this document.

3.1. TE Types Module

The ietf-te-types module contains common TE types that are independent and agnostic of any specific technology or control plane instance.

The ietf-te-types module imports the following modules:

- ietf-yang-types and ietf-inet-types defined in [RFC6991]
- ietf-routing-types defined in [RFC8294]

The ietf-te-types module contains the following YANG reusable types and groupings:

- te-bandwidth:
  A YANG grouping that defines the generic TE bandwidth. The modeling structure allows augmentation for each technology. For un-specified technologies, the string encoded te-bandwidth type is used.

- te-label:
  A YANG grouping that defines the generic TE label. The modeling structure allows augmentation for each technology. For un-specified technologies, rt-types:generalized-label is used.

- te-ds-class:
  A type representing the Differentiated-Services (DS) Class-Type of traffic as defined in [RFC4124].

- te-label-direction:
  An enumerated type for specifying the forward or reverse direction of a label.

- te-hop-type:
  An enumerated type for specifying hop as loose or strict.
te-global-id:

A type representing the identifier that uniquely identify an operator, which can be either a provider or a client. The definition of this type is taken from [RFC6370] and [RFC5003]. This attribute type is used solely to provide a globally unique context for TE topologies.

te-node-id:

A type representing the identifier for a node in a topology. The identifier is represented as 32-bit unsigned integer in the dotted-quad notation. This attribute is mapped to Router ID in [RFC3630], [RFC5329], [RFC5305], and [RFC6119].

te-topology-id:

A type representing the identifier for a topology. It is optional to have one or more prefixes at the beginning, separated by colons. The prefixes can be the network-types, defined in ietf-network, to help user to understand the topology better before further inquiry.

te-tp-id:

A type representing the identifier of a TE interface link termination endpoint (TP) on a specific TE node where the TE link connects. This attribute is mapped to local or remote link identifier in [RFC3630] and [RFC5305].

te-path-disjointness:

A type representing the different resource disjointness options for a TE tunnel path as defined in [RFC4872].

admin-groups:

A union type for TE link’s classic or extended administrative groups as defined in [RFC3630] and [RFC5305].

srig:

A type representing the Shared Risk Link Group (SRLG) as defined in [RFC4203] and [RFC5307].

te-metric:

A type representing the TE link metric as defined in [RFC3785].
te-recovery-status:

An enumerated type for the different status of a recovery action as defined in [RFC4427] and [RFC6378].

restoration-scheme-type:

A base YANG identity for supported LSP restoration schemes as defined in [RFC4872].

protection-external-commands:

A base YANG identity for supported protection external commands for trouble shooting purposes as defined in [RFC4427].

association-type:

A base YANG identity for supported Label Switched Path (LSP) association types as defined in [RFC6780], [RFC4872], [RFC4873].

objective-function-type:

A base YANG identity for supported path computation objective functions as defined in [RFC5541].

te-tunnel-type:

A base YANG identity for supported TE tunnel types as defined in [RFC3209] and [RFC4875].

lsp-encoding-types:

A base YANG identity for supported LSP encoding types as defined in [RFC3471].

lsp-protection-type:

A base YANG identity for supported LSP protection types as defined in [RFC4872] and [RFC4873].

switching-capabilities:

A base YANG identity for supported interface switching capabilities as defined in [RFC3471].

resource-affinities-type:
A base YANG identity for supported attribute filters associated with a tunnel that must be satisfied for a link to be acceptable as defined in [RFC2702] and [RFC3209].

path-metric-type:

A base YANG identity for supported path metric types as defined in [RFC3785] and [RFC7471].

performance-metric-container:

A YANG grouping that defines supported performance metrics as defined in [RFC7471] and [RFC7810].

explicit-route-hop:

A YANG grouping that defines supported explicit routes as defined in [RFC3209] and [RFC3477].

te-link-access-type:

An enumerated type for the different TE link access types as defined in [RFC3630].

3.2. MPLS TE Types Module

The ietf-te-mpls-types module covers the common types and groupings specific to MPLS technology.

The ietf-te-mpls-types module contains the following YANG reusable types and groupings:

backup-protection-type:

A base YANG identity for supported protection types that a backup or bypass tunnel can provide as defined in [RFC4090].

te-class-type:

A type that represents the Diffserv-TE class-type as defined in [RFC4124].

bc-type:

A type that represents the Diffserv-TE Bandwidth Constraint (BC) as defined in [RFC4124].

bc-model-type:
A base YANG identity for supported Diffserv-TE bandwidth constraint models as defined in [RFC4125], [RFC4126] and [RFC4127].

te-bandwidth-requested-type:

An enumerated type for the different options to request bandwidth for a specific tunnel.

performance-metric-container-packet:

A YANG grouping for the augmentation of packet specific metrics to the generic performance metrics grouping parameters.

4. IETF TE Types YANG Module

<CODE BEGINS> file "ietf-te-types@2018-12-21.yang"
module ietf-te-types {
  yang-version 1.1;

  /* Replace with IANA when assigned */
  prefix "te-types";

  import ietf-inet-types {
    prefix inet;
    reference "RFC6991: Common YANG Data Types";
  }

  import ietf-yang-types {

  }
  description
  "This is the generic bandwidth type that is a string containing
   a list of numbers separated by commas, with each of these
   number can be non-negative decimal, hex integer, or hex float:
   (dec | hex | float)[",(dec | hex | float)]
   For packet switching type, a float number is used, such as
   0x1p10.
   For OTN switching type, a list of integers can be used, such
   as '0,2,3,1', indicating 2 odu0’s and 1 odu3.
   For DWDM, a list of pairs of slot number and width can be
   used, such as '0, 2, 3, 3', indicating a frequency slot 0 with
   slot width 2 and a frequency slot 3 with slot width 3.
   Canonically, the string is represented as all lowercase and in
   hex where the prefix '0x' precedes the hex number";

6. IANA Considerations

This document registers the following URIs in the IETF XML registry [RFC3688]. Following the format in [RFC3688], the following registration is requested to be made.

URI: urn:ietf:params:xml:ns:yang:ietf-te-types XML: N/A, the requested URI is an XML namespace.

This document registers a YANG module in the YANG Module Names registry [RFC6020].

7. Security Considerations

This document defines common TE type definitions (i.e., typedef, identity and grouping statements) using the YANG data modeling language. The definitions themselves have no security or privacy impact on the Internet, but the usage of these definitions in concrete YANG modules might have. The security considerations spelled out in the YANG 1.1 specification [RFC7950] apply for this document as well.

8. Acknowledgement

The authors would like to thank the members of the multi-vendor YANG design team who are involved in the definition of these data types.

The authors would also like to thank Loa Andersson, Lou Berger, Sergio Belotti, Italo Busi, Carlo Perocchio, Francesco Lazzeri, Aihua
Guo, Dhruv Dhody, Anurag Sharma, and Xian Zhang for their comments and providing valuable feedback on this document.
