Definitions of Managed Objects for VRRPv3
<draft-ietf-vrrp-unified-mib-09.txt>

Abstract

This specification defines a portion of the Management Information Base (MIB) for use with SNMP-based network management. In particular, it defines objects for configuring, monitoring, and controlling routers that employ the Virtual Router Redundancy Protocol Version 3 for both IPv4 and IPv6 as defined in RFC 5798. This memo obsoletes RFC 2787.

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of BCP 78 and BCP 79.

This document may contain material from IETF Documents or IETF Contributions published or made publicly available before November 10, 2008. The person(s) controlling the copyright in some of this material may not have granted the IETF Trust the right to allow modifications of such material outside the IETF Standards Process. Without obtaining an adequate license from the person(s) controlling the copyright in such materials, this document may not be modified outside the IETF Standards Process, and derivative works of it may not be created outside the IETF Standards Process, except to format it for publication as an RFC or to translate it into languages other than English.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/1id-abstracts.txt.
The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html.

This Internet-Draft will expire in Oct, 2011.

1. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

2. Introduction

This specification defines a portion of the Management Information Base (MIB) for use with SNMP-based network management. In particular, it defines objects for configuring, monitoring, and controlling routers that employ the Virtual Router Redundancy Protocol Version 3 for both IPv4 and IPv6 as defined in RFC 5798 [RFC5798].

3. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

4. Relationship to RFC 2787

This document obsoletes RFC2787 [RFC2787]. The major changes in this document reflect changes in VRRP protocol between RFC 2338 [RFC2338] and RFC 5798 [RFC5798]. This document is also updated to conform to current MIB conventions.

5. Relation to Interface Group (IF-MIB)

Since a router can be participating in VRRP on one or more interfaces, "ifIndex" is used as an index into the tables defined in the VRRP MIB. This MIB module imports ifIndex from the IF-MIB. At this time, the latest version of IF-MIB is from RFC2863 [RFC2863].

6. Multi-Stack Implementations

This MIB module is designed to support Multi-Stack implementations.
that run VRRP over IPv4 and IPv6. IP version, VRID and ifIndex are used to uniquely identify rows in a multi stack implementation.

7. VRRP MIB Structure and Design

This MIB module contains three tables:

(1)  The `vrrpv3OperationsTable`, which contains objects that define the operational characteristics of a VRRP router. Rows in this table correspond to instances of virtual routers.
(2)  The `vrrpv3StatisticsTable` which contains the operating statistics for a VRRP router.
(3)  The `vrrpv3AssociatedIpAddrTable`, contains the addresses of the virtual router(s) that a given VRRP router is backing up.

Tables are indexed on ifIndex, VRID and the IP version to uniquely identify a VRRP router.

Notifications in this MIB module are controlled using the mechanisms defined in [RFC3413].

8. VRRP Multistack Scenario

The following section provides examples of how some of the objects in this MIB are instantiated.

KEY:
-----

The labels in the following tables and diagrams correspond to the actual MIB objects as follows:

```
if      = IfIndex
AddrType= vrrpv3OperationsInetAddrType
VrId    = vrrpv3OperationsVrId
State   = vrrpv3OperationsStatus
Prior   = vrrpv3OperationsPriority
IpAddr  = vrrpv3OperationsMasterIpAddr
```

The following figure shows a hypothetical network with two VRRP routers VR1 & VR2, configured with two virtual routers. Addresses in ‘()’ indicate the address of the default gateway for a given host, H1 to H4 are IPv4 hosts and H5 to H8 are IPv6 hosts. A, B and C are IPv4
addresses and X, Y and Z are IPv6 addresses. In the diagram, "Interface" is used in the context defined in IF-MIB.

```

</table>
NOTES:

1) For "State": M = Master;   B = Backup.
   In the vrrpv3OperationsTable, a "priority" of 255 indicates that the
   respective router owns the IP address, e.g., this IP address is
   native to the router (i.e., "the IP Address Owner").

SYNTAX       InetAddress
MAX-ACCESS   read-create
STATUS       current
DESCRIPTION
"In the case where there is more than one IP Address (associated IP addresses) for a given 'ifIndex', this object is used to specify the IP address that will become the vrrpv3OperationsMasterIpAddr', should the virtual router transition from backup state to master."
 ::= { vrrpv3OperationsEntry 4 }

vrrpv3OperationsVirtualMacAddr OBJECT-TYPE
SYNTAX       MacAddress
MAX-ACCESS   read-only
STATUS       current
DESCRIPTION
"The virtual MAC address of the virtual router. Although this object can be derived from the 'vrrpv3OperationsVrId' object, it is defined so that it is easily obtainable by a management application and can be included in VRRP-related SNMP notifications."
 ::= { vrrpv3OperationsEntry 5 }

vrrpv3OperationsStatus OBJECT-TYPE
SYNTAX       INTEGER { initialize(1),
                      backup(2),
                      master(3) }
MAX-ACCESS   read-only
STATUS       current
DESCRIPTION
"The current state of the virtual router. This object has three defined values:

- 'initialize', which indicates that the virtual router is waiting for a startup event.
- 'backup', which indicates the virtual router is monitoring the availability of the master router.

- 'master', which indicates that the virtual router is forwarding packets for IP addresses that are associated with this router."

REFERENCE " RFC 5798"
::= { vrrpv3OperationsEntry 6 }

vrrpv3OperationsPriority OBJECT-TYPE
SYNTAX       Unsigned32 (0..255)
MAX-ACCESS   read-create
STATUS       current
DESCRIPTION
"This object specifies the priority to be used for the virtual router master election process. Higher values imply higher priority.

A priority of '0', although not settable, is sent by the master router to indicate that this router has ceased to participate in VRRP and a backup virtual router should transition to become a new master.

A priority of 255 is used for the router that owns the associated IP address(es) for VRRP over IPv4 and hence not settable.

A 'badValue(3)' should be returned when a user tries to set 0 or 255 for this object."
REFERENCE " RFC 5798 section 6.1"
DEFVAL       { 100 }
::= { vrrpv3OperationsEntry 7 }

vrrpv3OperationsAcceptMode OBJECT-TYPE
SYNTAX TruthValue
MAX-ACCESS read-create
STATUS current
DESCRIPTION "Controls whether a virtual router in Master state will accept packets addressed to the address owner’s IPv6 address as its own if it is not the IPv6 address owner. Default is false(2). This object is not relevant for rows representing VRRP over IPv4 and should be set to false(2)."
DEFVAL { false }
 ::= { vrrpv3OperationsEntry 11 }

vrrpv3OperationsUpTime OBJECT-TYPE
SYNTAX TimeTicks
MAX-ACCESS read-only
STATUS current
DESCRIPTION "This value represents the amount of time since this virtual router (i.e., the ‘vrrpv3OperationsStatus’) transitioned out of ‘initialize’." 
REFERENCE "RFC 5798 section 6.1"
 ::= { vrrpv3OperationsEntry 12 }

vrrpv3OperationsRowStatus OBJECT-TYPE
SYNTAX RowStatus
MAX-ACCESS read-create
STATUS current
"The RowStatus variable should be used in accordance to installation and removal conventions for conceptual rows.

To create a row in this table, a manager sets this object to either createAndGo(4) or createAndWait(5). Until instances of all corresponding columns are appropriately configured, the value of the Corresponding instance of the 'vrrpv3OperationsRowStatus' column will be read as notReady(3).

In particular, a newly created row cannot be made active(1) until (minimally) the corresponding instance of vrrpv3OperationsInetAddrType, vrrpv3OperationsVrId and vrrpv3OperationsPrimaryIpAddr has been set and there is at least one active row in the 'vrrpv3AssociatedIpAddrTable' defining an associated IP address.

notInService(2) should be used to administratively bring the row down.

A typical order of operation to add a row is:
1. Create a row in vrrpv3OperationsTable with createAndWait(5).
2. Create one or more corresponding rows in vrrpv3AssociatedIpAddrTable.
3. Populate the vrrpv3OperationsEntry.
4. set vrrpv3OperationsRowStatus to active(1).

A typical order of operation to delete an entry is:
1. Set vrrpv3OperationsRowStatus to notInService(2).
2. Set the corresponding rows in vrrpv3AssociatedIpAddrTable to destroy(6) to delete the entry.
3. set vrrpv3OperationsRowStatus to destroy(6) to delete the entry."

-- VRRP Associated Address Table

vrrpv3AssociatedIpAddrTable OBJECT-TYPE
SYNTAX       SEQUENCE OF Vrrpv3AssociatedIpAddrEntry
MAX-ACCESS   not-accessible
STATUS       current
DESCRIPTION  "The table of addresses associated with each virtual
router.

::= { vrrpv3Operations 2 }

vrrpv3AssociatedIpAddrEntry OBJECT-TYPE
SYNTAX Vrrpv3AssociatedIpAddrEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"An entry in the table contains an IP address that is associated with a virtual router. The number of rows for a given IP version, VrID and ifIndex will equal the number of IP addresses associated (e.g., backed up) by the virtual router (equivalent to 'vrrpv3OperationsIpAddrCount').

Rows in the table cannot be modified unless the value of 'vrrpv3OperationsStatus' for the corresponding entry in the vrrpv3OperationsTable has transitioned to initialize(1).

The information in this table is persistent and when written the entity SHOULD save the change to non-volatile storage."

INDEX { ifIndex, vrrpv3OperationsVrId, vrrpv3OperationsInetAddrType, vrrpv3AssociatedIpAddrAddress }

::= { vrrpv3AssociatedIpAddrTable 1 }

Vrrpv3AssociatedIpAddrEntry ::= 
SEQUENCE {
  vrrpv3AssociatedIpAddrAddress InetAddress,
  vrrpv3AssociatedIpAddrRowStatus RowStatus
}

vrrpv3AssociatedIpAddrAddress OBJECT-TYPE
SYNTAX InetAddress (SIZE (0|4|16))
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"The assigned IP addresses that a virtual router is responsible for backing up.

The IP address type is determined by the value of vrrpv3OperationsInetAddrType in the index of this row"
vrrpv3AssociatedIpAddrRowStatus OBJECT-TYPE
SYNTAX       RowStatus
MAX-ACCESS   read-create
STATUS       current
DESCRIPTION
"The row status variable, used according to
installation and removal conventions for conceptual
rows. To create a row in this table, a manager sets
this object to either createAndGo(4) or
createAndWait(5). Setting this object to active(1)
results in the addition of an associated address for a
virtual router. Setting this object to notInService(2)
results in administratively bringing down the row.

Destroying the entry or setting it to destroy(6)
removes the associated address from the virtual router.
The use of other values is implementation-dependent.

Implementations should not allow deletion of the last
row corresponding to an active row in
vrrpv3OperationsTable.

Refer to description of vrrpv3OperationsRowStatus for a
typical row creation and deletion scenarios."

}
vrrpv3StatisticsMasterTransitions OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The total number of times that this virtual router’s state has transitioned to MASTER.
Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpv3StatisticsRowDiscontinuityTime."
::= { vrrpv3StatisticsEntry 1 }

vrrpv3StatisticsNewMasterReason OBJECT-TYPE
SYNTAX INTEGER {
   notMaster (0),
   priority (1),
   preempted (2),
   masterNoResponse (3)
 }
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"This indicates the reason for the virtual router to transition to MASTER state. If the virtual router never transitioned to master state, this SHOULD be set to notMaster(0). Otherwise this indicates the reason this virtual router transitioned to master state the last time. Used by vrrpv3NewMaster notification."
::= { vrrpv3StatisticsEntry 2 }

vrrpv3StatisticsRcvdAdvertisements OBJECT-TYPE
SYNTAX Counter64
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"The total number of VRRP advertisements received by this virtual router.
Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpv3StatisticsRowDiscontinuityTime."
vrrpv3StatisticsAdvIntervalErrors OBJECT-TYPE
SYNTAX Counter64
MAX-ACCESS read-only
STATUS current
DESCRIPTION "The total number of VRRP advertisement packets received for which the advertisement interval is different from the vrrpv3OperationsAdvInterval configured on this virtual router.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpv3StatisticsRowDiscontinuityTime."

vrrpv3StatisticsIpTtlErrors OBJECT-TYPE
SYNTAX Counter64
MAX-ACCESS read-only
STATUS current
DESCRIPTION "The total number of VRRP packets received by the virtual router with IPv4 TTL (for VRRP over IPv4) or IPv6 Hop Limit (for VRRP over IPv6) not equal to 255.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpv3StatisticsRowDiscontinuityTime."

REFERENCE "RFC 5798 Section 5.1.1.3"

vrrpv3StatisticsProtoErrReason OBJECT-TYPE
SYNTAX INTEGER {
    noError (0),
    ipTtlError (1),
    versionError (2),
    checksumError (3),
    vrIdError(4)
}
MAX-ACCESS read-only
STATUS current
DESCRIPTION "This indicates the reason for the last protocol error. This SHOULD be set to noError(0) when no protocol errors are encountered. Used by vrrpv3ProtoError"
::= { vrrpv3StatisticsEntry 6 }

vrrpv3StatisticsRcvdPriZeroPackets OBJECT-TYPE
SYNTAX       Counter64
MAX-ACCESS   read-only
STATUS       current
DESCRIPTION
"The total number of VRRP packets received by the
virtual router with a priority of ‘0’.

Discontinuities in the value of this counter can occur
at re-initialization of the management system, and at
other times as indicated by the value of
vrrpv3StatisticsRowDiscontinuityTime."
REFERENCE "RFC 5798 Section 5.2.4"
::= { vrrpv3StatisticsEntry 7 }

vrrpv3StatisticsSentPriZeroPackets OBJECT-TYPE
SYNTAX       Counter64
MAX-ACCESS   read-only
STATUS       current
DESCRIPTION
"The total number of VRRP packets sent by the virtual
router with a priority of ‘0’.

Discontinuities in the value of this counter can occur
at re-initialization of the management system, and at
other times as indicated by the value of
vrrpv3StatisticsRowDiscontinuityTime."
REFERENCE "RFC 5798 Section 5.3.4"
::= { vrrpv3StatisticsEntry 8 }

vrrpv3StatisticsRcvdInvalidTypePackets OBJECT-TYPE
SYNTAX       Counter64
MAX-ACCESS   read-only
STATUS       current
DESCRIPTION
"The number of VRRP packets received by the virtual
router with an invalid value in the ‘type’ field.

Discontinuities in the value of this counter can occur
at re-initialization of the management system, and at
other times as indicated by the value of
vrrpv3StatisticsRowDiscontinuityTime."
::= { vrrpv3StatisticsEntry 9 }
vrrpv3StatisticsAddressListErrors OBJECT-TYPE
SYNTAX       Counter64
MAX-ACCESS   read-only
STATUS       current
DESCRIPTION
 "The total number of packets received for which the address list does not match the locally configured list for the virtual router.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpv3StatisticsRowDiscontinuityTime."
 ::= { vrrpv3StatisticsEntry 10 }

vrrpv3StatisticsPacketLengthErrors OBJECT-TYPE
SYNTAX       Counter64
MAX-ACCESS   read-only
STATUS       current
DESCRIPTION
 "The total number of packets received with a packet length less than the length of the VRRP header.

Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpv3StatisticsRowDiscontinuityTime."
 ::= { vrrpv3StatisticsEntry 11 }

vrrpv3StatisticsRowDiscontinuityTime OBJECT-TYPE
SYNTAX       TimeStamp
MAX-ACCESS   read-only
STATUS       current
DESCRIPTION
 "The value of sysUpTime on the most recent occasion at which any one or more of this entry’s counters suffered a discontinuity.

If no such discontinuities have occurred since the last re-initialization of the local management subsystem, then this object contains a zero value."
 ::= { vrrpv3StatisticsEntry 12 }

vrrpv3StatisticsRefreshRate OBJECT-TYPE
SYNTAX       Unsigned32
UNITS "milli-seconds"
MAX-ACCESS   read-only
STATUS current
DESCRIPTION "The minimum reasonable polling interval for this entry. This object provides an indication of the minimum amount of time required to update the counters in this entry."

::= { vrrpv3StatisticsEntry 13 }

-- Notification Definitions
-- Notifications may be controlled using SNMP-NOTIFICATION-MIB

vrrpv3NewMaster NOTIFICATION-TYPE
OBJECTS {
    vrrpv3OperationsMasterIpAddr,
    vrrpv3StatisticsNewMasterReason

10. Security Considerations

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write and/or read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure
environment without proper protection can have a negative effect on network operations. These are the tables and objects and their sensitivity/vulnerability:

Specific examples of this include, but are not limited to:

- The vrrpv3OperationsRowStatus object which could be used to disable a virtual router. While there are other columns that, if changed, could disrupt operations, they can not be changed without first changing the RowStatus object.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [RFC3410], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

11. IANA Considerations

The MIB module in this document uses the following IANA-assigned OBJECT IDENTIFIER values recorded in the SMI Numbers registry:

<table>
<thead>
<tr>
<th>Descriptor</th>
<th>OBJECT IDENTIFIER value</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrrpv3MIB</td>
<td>{ mib-2 ZZZ }</td>
</tr>
</tbody>
</table>

Tata Expires Oct 2011 [Page 27]
[Editor’s Note (to be removed prior to publication): The IANA is requested to assign a value for "ZZZ" under the 'mib-2' subtree and to record the assignment in the SMI Numbers registry. When the assignment has been made, the RFC Editor is asked to replace "ZZZ" (here and in the MIB module) with the assigned value.

This document obsoletes RFC 2787 and the IANA is requested to deprecate the value 68 under 'mib-2' assigned to VRRP-MIB.]

12. Normative References

13. Informative References

14. Acknowledgments

Kripakaran Karlekar and Brain Jewell helped in design and initial drafts of this specification. This specification is based on RFC
2787. The authors of RFC2787 are Brian Jewell and David Chuang. The author would also like to thank Bert Wijnen, Dave Thaler, Joan Cucchiara, Mukesh Gupta, Steve Bates and Adrian Farrel, for taking time to review the document and provide valuable guidance.
