Flowspec Indirection-id Redirect for SRv6
draft-ietf0-idr-srv6-flowspec-path-redirect-02

Abstract

This document defines extensions to "Flowspec Redirect to indirection-id Extended Community" for SRv6. This extended community can trigger advanced redirection capabilities to flowspec clients for SRv6. When activated, this flowspec extended community is used by a flowspec client to retrieve the corresponding next-hop and encoding information within a localised indirection-id mapping table.

The functionality detailed in this document allows a network controller to decouple the BGP flowspec redirection instruction from the operation of the available paths.

Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [2].

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."
1. Introduction

"FlowSpec Redirect to indirection-id Extended Community" for IPv4 is defined in ietf-idr-flowspec-path-redirect [1]. This draft specifies extensions to this community for SRv6.

2. Redirect to indirection-id Community

This document defines a new sub-type value for SRv6 in "FlowSpec Redirect to indirection-id Extended Community". The format of this extended community with the new sub-type value is show below:
Where

Type: 1 octet, defined in ietf-idr-flowspec-path-redirect [1].

Sub-Type: 1 octet, its value (TBD) will be assigned by IANA.

Flags: Same as that defined in ietf-idr-flowspec-path-redirect [1].

ID-Type: 1 octet value. This draft defines following Context Types:

0 - Localised ID (The flowspec client uses the received
indirection-id to lookup forwarding information within the
localised indirection-id table. The allocation and programming of
the localised indirection-id table is outside scope of the
document)

1 - Node ID with SID/index in MPLS-based Segment Routing (This
means the indirection-id is mapped to an MPLS label using the
index as a global offset in the SID/label space)

2 - Node ID with SID/label in MPLS-based Segment Routing (This
means the indirection-id is mapped to an MPLS label using the
indirection-id as global label)

3 - Binding Segment ID with SID/index in MPLS-based Segment
Routing (This means the indirection-id is mapped to an MPLS
binding label using the indirection-id as index for global offset
in the SID/label space).

4 - Binding Segment ID with SID/label in MPLS-based Segment
Routing (This means indirection-id is mapped to an MPLS binding
label using the indirection-id as global label).

5 - Tunnel ID (Tunnel ID is within a single administrative domain
a globally unique tunnel identifier. The allocation and
programming of the Tunnel ID within the localised indirection-id
table is outside scope of the document)
6 - Node ID with SID/index in SRv6 (This means the indirection-id is mapped to an SRv6 SID using the indirection-id as global SRv6 SID or index)

7 - Binding Segment ID with SID/index in SRv6 (This means the indirection-id is mapped to an SRv6 binding SID using the indirection-id as index for global offset in the SID space).

8 - Binding Segment ID with SID/index in SRv6 (This means indirection-id is mapped to an SRv6 binding SID using the indirection-id as global SRv6 SID).

Generalized indirection_id: 128-bit identifier used as indirection_id

3. Security Considerations

A system using "Redirect to indirection-id" extended community can cause during the redirect mitigation of a DDoS attack overflow of traffic received by the mitigation infrastructure.

4. Acknowledgements

This document received valuable comments and input from IDR working group including Adam Simpson, Mustapha Aissaoui, Jan Mertens, Robert Raszuk, Jeff Haas, Susan Hares and Lucy Yong.

5. Contributor Addresses

Below is a list of other contributing authors in alphabetical order:
6. IANA Considerations

This document requests a new sub-type value under "FlowSpec Redirect to indirection-id Extended Community Sub-Type" registry.
