A Yang Data Model for ACTN VN Operation

draft-lee-teas-actn-vn-yang-13

Abstract

This document provides a YANG data model for the Abstraction and Control of Traffic Engineered (TE) networks (ACTN) Virtual Network Service (VNS) operation.

## 1. Introduction

This document provides a YANG data model for the Abstraction and Control of Traffic Engineered (TE) networks (ACTN) Virtual Network Service (VNS) operation that is going to be implemented for the Customer Network Controller (CNC)- Multi-Domain Service Coordinator (MSDC) interface (CMI).

The YANG model on the CMI is also known as customer service model in [Service-YANG]. The YANG model discussed in this document is used to operate customer-driven VNs during the VN computation, VN instantiation and its life-cycle management and operations.

The YANG model discussed in this document basically provides the following:

- Characteristics of Access Points (APs) that describe customer’s end point characteristics;
- Characteristics of Virtual Network Access Points (VNAP) that describe how an AP is partitioned for multiple VNs sharing the AP and its reference to a Link Termination Point (LTP) of the Provider Edge (PE) Node;
- Characteristics of Virtual Networks (VNs) that describe the customer’s VNs in terms of VN Members comprising a VN, multi-source and/or multi-destination characteristics of VN Member, the VN’s reference to TE-topology’s Abstract Node;

The actual VN instantiation is performed with Connectivity Matrices sub-module of TE-Topology Model [TE-Topo] which interacts with the VN YANG module presented in this draft. Once TE-topology Model is used in triggering VN instantiation over the networks, TE-tunnel [TE-tunnel] Model will inevitably interact with TE-Topology model for setting up actual tunnels and LSPs under the tunnels.

The ACTN VN operational state is included in the same tree as the configuration consistent with Network Management Datastore Architecture (NMDA) [NMDA]. The origin of the data is indicated as per the origin metadata annotation.
1.1. Terminology

Refer to [ACTN-Frame] and [RFC7926] for the key terms used in this document.

2. ACTN CMI context

The model presented in this document has the following ACTN context.

```
+-------+
|  CNC  |
+-------+
    |
    VN YANG + TE-topology YANG
    |
    +-----------------------+
        | MDSC                  |
    +-----------------------+
```

Figure 1. ACTN CMI

Both ACTN VN YANG and TE-topology models are used over the CMI to establish a VN over TE networks.

2.1. Type 1 VN

As defined in [ACTN-FW], a Virtual Network is a customer view of the TE network. To recapitulate VN types from [ACTN-FW], Type 1 VN is defined as follows:

The VN can be seen as a set of edge-to-edge links (a Type 1 VN). Each link is referred to as a VN member and is formed as an end-to-end tunnel across the underlying networks. Such tunnels may be constructed by recursive slicing or abstraction of paths in the underlying networks and can encompass edge points of the customer’s network, access links, intra-domain paths, and inter-domain links.

If we were to create a VN where we have four VN-members as follows:

| VN-Member 1   | L1-L4 |
| VN-Member 2   | L1-L7 |
| VN-Member 3   | L2-L4 |
| VN-Member 4   | L3-L8 |
Where L1, L2, L3, L4, L7 and L8 correspond to a Customer End-Point, respectively.

This VN can be modeled as one abstract node representation as follows in Figure 2:

```
+---------------+
L1 ------|               |------ L4
L2 ------|     AN 1      |------ L7
L3 ------|               |------ L8
+---------------+
```

Figure 2. Abstract Node (One node topology)

Modeling a VN as one abstract node is the easiest way for customers to express their end-to-end connectivity; however, customers are not limited to express their VN only with one abstract node. In some cases, more than one abstract nodes can be employed to express their VN.

2.2. Type 2 VN

For some VN members of a VN, the customers are allowed to configure the actual path (i.e., detailed virtual nodes and virtual links) over the VN/abstract topology agreed mutually between CNC and MDSC prior to or a topology created by the MDSC as part of VN instantiation. Type 2 VN is always built on top of a Type 1 VN.

If a Type 2 VN is desired for some or all of VN members of a type 1 VN (see the example in Section 2.1), the TE-topology model can provide the following abstract topology (that consists of virtual nodes and virtual links) which is built on top of the Type 1 VN.
As you see from Figure 3, the Type 1 abstract node is depicted as a Type 1 abstract topology comprising of detailed virtual nodes and virtual links.

As an example, if VN-member 1 (L1-L4) is chosen to configure its own path over Type 2 topology, it can select, say, a path that consists of the ERO \{S3, S4, S5\} based on the topology and its service requirement. This capability is enacted via TE-topology configuration by the customer.

3. High-Level Control Flows with Examples

3.1. Type 1 VN Illustration

If we were to create a VN where we have four VN-members as follows:

| VN-Member 1   | L1-L4 |
| VN-Member 2   | L1-L7 |
| VN-Member 3   | L2-L4 |
| VN-Member 4   | L3-L8 |

Where L1, L2, L3, L4, L7 and L8 correspond to Customer End-Point, respectively.
This VN can be modeled as one abstract node representation as follows:

```
+---------------+
L1 ------|               |------ L4
L2 ------|     AN 1      |------ L7
L3 ------|               |------ L8
+---------------+
```

If this VN is Type 1, the following diagram shows the message flow between CNC and MDSC to instantiate this VN using ACTN VN and TE-Topology Model.

```
+--------+                                +--------+
|  CNC   |                                |  MDSC  |
+--------+                                +--------+
|                  |                  |
|                  |                  |
CNC POST TE-topo |  POST /nw:network/
model(with Conn. |  nw:node/te-node-id/tet:connectivity-
Matrix on one    |  matrices/tet:connectivity-matrix

|<----------------------------------------|
|                  |                  |
|                  |                  |
CNC POST the ACTN |  POST /ACTN VN                          |
VN identifying    |---------------------------------------->| If there is
AP, VNAP and VN- |                                         | multi-dest’n
Members and maps  |                         HTTP 200        | module, then
 to the TE-topo   |<----------------------------------------| MDSC selects a
|                  |                                         | src or dest’n
|                  |                                         | and update
CNC GET the ACTN |  GET /ACTN VN                           |
VN YANG status    |---------------------------------------->|
| HTTP 200 (ACTN VN with status: selected|
| VN-members in case of multi s-d         |<----------------------------------------|
|                                         |                                          |
```
3.2. Type 2 VN Illustration

For some VN members, the customer may want to "configure" explicit routes over the path that connects its two end-points. Let us consider the following example.

VN-Member 1       L1-L4
VN-Member 2       L1-L7 (via S4 and S7)
VN-Member 3       L2-L4
VN-Member 4       L3-L8 (via S10)

Where the following topology is the underlay for Abstraction Node 1 (AN1).

If CNC creates the single abstract topology, the following diagram shows the message flow between CNC and MDSC to instantiate this VN using ACTN VN and TE-Topology Model.
| CNC | MDSC |
|-----+-----|

CNC POST TE-topo model (with Conn. Matrix on one Abstract node and Explicit paths in The conn. Matrix) HTTP 200

CNC POST the ACTN VN identifying AP, VNAP and VN-Members and maps to the TE-topo HTTP 200

CNC GET the ACTN VN YANG status HTTP 200 (ACTN VN with status)

On the other hand, if MDSC create single node topology based ACTN VN YANG posted by the CNC, the following diagram shows the message flow between CNC and MDSC to instantiate this VN using ACTN VN and TE-Topology Model.

| CNC | MDSC |
|-----+-----|

CNC POST ACTN VN Identifying AP, VNAP and VN-Members POST /ACTN VN HTTP 200

MDSC populates a single Abst. node topology by itself
4. Justification of the ACTN VN Model on the CMI.

4.1. Customer view of VN

The VN-Yang model allows to define a customer view, and allows the customer to communicate using the VN constructs as described in the [ACTN-INFO]. It also allows to group the set of edge-to-edge links (i.e., VN members) under a common umbrella of VN. This allows the customer to instantiate and view the VN as one entity, making it easier for some customers to work on VN without worrying about the details of the provider based YANG models.

This is similar to the benefits of having a separate YANG model for the customer services as described in [SERVICE-YANG], which states that service models do not make any assumption of how a service is actually engineered and delivered for a customer.

4.2. Innovative Services

4.2.1. VN Compute

ACTN VN supports VN compute (pre-instantiation mode) to view the full VN as a single entity before instantiation. Achieving this via path computation or "compute only" tunnel setup does not provide the same functionality.
4.2.2. Multi-sources and Multi-destinations

In creating a virtual network, the list of sources or destinations or both may not be pre-determined by the customer. For instance, for a given source, there may be a list of multiple destinations to which the optimal destination may be chosen depending on the network resource situations. Likewise, for a given destination, there may also be multiple sources from which the optimal source may be chosen. In some cases, there may be a pool of multiple sources and destinations from which the optimal source-destination may be chosen. The following YANG module is shown for describing source container and destination container. The following YANG tree shows how to model multi-sources and multi-destinations.

```
++-rw actn
  .
  +-rw vn
     +-rw vn-list* [vn-id]
       ++-rw vn-id uint32
       +-rw vn-name? string
       +-rw vn-topology-id? te-types:te-topology-id
       +-rw vn-member-list* [vn-member-id]
         ++-rw vn-member-id uint32
         +-rw src
           | +-rw src? -> /actn/ap/access-point-list/access-point-id
           | +-rw src-vn-ap-id? -> /actn/ap/access-point-list/vn-ap/vn-ap-id
           | +-rw multi-src? boolean {multi-src-dest}?
           | +-rw dest
             | | +-rw dest? -> /actn/ap/access-point-list/access-point-id
             | | +-rw dest-vn-ap-id? -> /actn/ap/access-point-list/vn-ap/vn-ap-id
             | | +-rw multi-dest? boolean {multi-src-dest}?
             | | +-ro oper-status? identityref
             | | +-ro if-selected? boolean {multi-src-dest}?
             | +-rw admin-status? identityref
             | +-ro oper-status? identityref
```

4.2.3. Others

The VN Yang model can be easily augmented to support the mapping of VN to the Services such as L3SM and L2SM as described in [TE-MAP].
The VN Yang model can be extended to support telemetry, performance monitoring and network autonomies as described in [ACTN-PM].

4.3. Summary

This section summarizes the innovative service features of the ACTN VN Yang.

- Maintenance of AP and VNAP along with VN.
- VN construct to group of edge-to-edge links
- VN Compute (pre-instantiate)
- Multi-Source / Multi-Destination
- Ability to support various VN and VNS Types
  * VN Type 1: Customer configures the VN as a set of VN Members. No other details need to be set by customer, making for a simplified operations for the customer.
  * VN Type 2: Along with VN Members, the customer could also provide an abstract topology, this topology is provided by the Abstract TE Topology Yang Model.

7. JSON Example

This section provides json implementation examples as to how ACTN VN YANG model and TE topology model are used together to instantiate virtual networks.

The example in this section includes following VN

- **VN1 (Type 1)**: Which maps to the single node topology abstract1 (node D1) and consist of VN Members 104 (L1 to L4), 107 (L1 to L7), 204 (L2 to L4), 308 (L3 to L8) and 108 (L1 to L8). We also show how disjointness (node, link, srlg) is supported in the example on the global level (i.e., connectivity matrices level).
o VN2 (Type 2): Which maps to the single node topology abstract2 (node D2), this topology has an underlay topology (absolute) (see figure in section 3.2). This VN has a single VN member 105 (L1 to L5) and an underlay path (S4 and S7) has been set in the connectivity matrix of abstract2 topology;

o VN3 (Type 1): This VN has a multi-source, multi-destination feature enable for VN Member 104 (L1 to L4)/107 (L1 to L7) [multi-src] and VN Member 204 (L2 to L4)/304 (L3 to L4) [multi-dest] usecase. The selected VN-member is known via the field "if-selected" and the corresponding connectivity-matrix-id.

Note that the ACTN VN YANG model also include the AP and VNAP which shows various VN using the same AP.

7.1. ACTN VN JSON
