YANG Types for DNS Classes and Resource Record Types
draft-lhotka-dnsop-iana-class-type-yang-01

Abstract

This document contains the initial revision of the YANG module iana-
dns-class-rr-type that contains derived types reflecting two IANA
registries: DNS CLASSes and Resource Record (RR) TYPES. These YANG
types are intended as a minimum basis for future data modeling work.

Status of This Memo

This Internet-Draft is submitted in full conformance with the
provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering
Task Force (IETF). Note that other groups may also distribute
working documents as Internet-Drafts. The list of current Internet-
Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months
and may be updated, replaced, or obsoleted by other documents at any
time. It is inappropriate to use Internet-Drafts as reference
material or to cite them other than as "work in progress."

This Internet-Draft will expire on 31 August 2019.

1. Introduction

YANG [RFC7950] has become a de facto standard as a language for modeling configuration and state data, as well as specifying management operations and asynchronous notifications. It is reasonable to expect that the approach based on utilizing such data models along with standard management protocols such as NETCONF and RESTCONF can be effectively used in DNS operations, too. In fact, several efforts are currently underway that attempt to use NETCONF or RESTCONF for configuring and managing

* authoritative servers
* resolvers
* zone data.

While it is possible to use the management protocols mentioned above with ad hoc or proprietary data models, their real potential can be realized only if there is a (completely or partly) unified data model supported by multiple DNS software implementations. Operators can then, for instance, run several different DNS servers in parallel, and use a common configuration and management interface and data for all of them. Also, it becomes considerably easier to migrate to another implementation.

Based on the previous experience from the IETF Routing Area, it is to be expected that the development of unified data models for DNS will be a lengthy and complicated process that will require active cooperation and compromises from the vendors and developers of major DNS server platforms. Nevertheless, it is likely that any DNS-related data modeling effort will need to use various DNS parameters and enumerations that are specified in several IANA registries. For use with YANG, these parameters and enumerations have to be translated into corresponding YANG types or other structures. Such translations should be straightforward and relatively uncontroversial.

This document is a first step in translating DNS-related IANA registries to YANG. It contains the initial revision of the YANG module "iana-dns-class-rr-type" that defines derived types for the common parameters of DNS resource records (RR): class and type. These YANG types, "dns-class" and "rr-type", reflect the IANA registries "DNS CLASSes" and "Resource Record (RR) TYPES" [IANA-DNS-PARAMETERS].

It is worth emphasizing that the role of the DNSOP Working Group is only in preparing and publishing this initial revision of the YANG module. Subsequently, whenever a new class or RR type is added to the above registries, IANA will also update the iana-dns-class-rr-type YANG module, following the instructions in Section 4 below.

2. YANG Design Considerations

The IANA document "Domain Name System (DNS) Parameters" [IANA-DNS-PARAMETERS] contains altogether thirteen registries. The YANG module iana-dns-class-rr-type defines derived types corresponding to only two of the registries that are essential for data models involving zone data, namely "DNS CLASSes" and "Resource Record (RR) TYPES". It is expected that the remaining registries in [IANA-DNS-PARAMETERS], as well as other DNS-related IANA registries, will be analogically
reflected in future YANG modules as necessary. This way, an appropriate combination of YANG modules can be chosen depending on which YANG types are needed for a given data modeling purpose.

[RFC3597] introduced the option of specifying a class or type via its assigned decimal number, as an alternative to the mnemonic name. For example, the "IN" class can be equivalently written as "CLASS1", and "AAAA" type as "TYPE28".

Accordingly, the derived types "dns-class" and "rr-type" are defined in the YANG module as a union of two member types:

* 16-bit decimal integer ("uint16")

* mnemonic name, represented by the enumeration type "dns-class-name" and "rr-type-name", respectively.

As unassigned and reserved class and types values are not included in the mnemonic name enumerations, they can be used only via their decimal codes.

3. YANG Module

RFC Editor: In this section, replace all occurrences of "XXXXX" with the actual RFC number and all occurrences of the revision date below with the date of RFC publication (and remove this note).

}
or the meaning of the new RR type, if any.

"reference": Replicate the reference from the registry, if any, and add the title of the document, if applicable.

Unassigned or reserved values are not included in the "dns-class-name" and "rr-type-name" enumeration types.

Each time the iana-dns-class-rr-type YANG module is updated, a new "revision" statement must be added before the existing "revision" statements.

IANA has added this new note to the "DNS CLASSes" and "Resource Record (RR) TYPES" registries:

When this registry is modified, the YANG module iana-dns-class-rr-type must be updated as defined in RFC XXXX.

The "Reference" text in the "DNS CLASSes" registry has been updated as follows:

OLD:
[ RFC6895 ]

NEW:
[ RFC6895 ][RFCXXXX]

The "Reference" text in the "Resource Record (RR) TYPES" registry has been updated as follows:

OLD:
[ RFC6895 ][RFC1035]

NEW:
[ RFC6895 ][RFC1035][RFCXXXX]

4.1. URI Registrations

This document registers a URI in the "IETF XML Registry" [RFC3688]. The following registration has been made:

Registrant Contact: The IESG.
XML: N/A, the requested URI is an XML namespace.

4.2. YANG Module Registrations

This document registers a YANG module in the "YANG Module Names" registry [RFC6020]. The following registration has been made:

name: iana-dns-class-rr-type
prefix: dnsct
reference: RFC XXXX

5. Security Considerations

This document translates two IANA registries into YANG data types and otherwise introduces no technology or protocol. Consequently, there are no security issues to be considered for this document.
