Yang Data Model for BGP/MPLS IP VPN
draft-li-bess-l3vpn-yang-01

Abstract

This document defines a YANG data model that can be used to configure and manage L3VPN (BGP/MPLS IP VPN).

Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on June 23, 2016.
1. Introduction

YANG [RFC6020] is a data definition language that was introduced to define the contents of a conceptual data store that allows networked devices to be managed using NETCONF [RFC6241]. YANG is proving relevant beyond its initial confines, as bindings to other interfaces (e.g. ReST) and encodings other than XML (e.g. JSON) are being defined. Furthermore, YANG data models can be used as the basis of implementation for other interfaces, such as CLI and programmatic APIs.

This document defines a YANG data model that can be used to configure and manage L3VPN (BGP/MPLS IP VPN) [RFC4364].
2. Definitions and Acronyms

AF: Address Family

BGP: Border Gateway Protocol

JSON: JavaScript Object Notation

L3VPN: Layer 3 VPN

NETCONF: Network Configuration Protocol

ReST: Representational State Transfer, a style of stateless interface and protocol that is generally carried over HTTP

YANG: A data definition language for NETCONF

3. Design of the L3VPN Model

3.1. Overview

The L3VPN Yang module is to augment the routing instance Yang models proposed by the draft [I-D.ietf-netmod-routing-cfg]. It introduced the "l3vpn" container to define augmented parameters which can be applied for VRF Routing Instance and support both the IPv4 and IPv6 address families. The overview of the "l3vpn" container is shown in the following figure:

module: ietf-l3vpn
augment /rt:routing/rt:routing-instance:
  +--rw l3vpn
    +--rw ipv4-family
      +--rw bgp-parameters
        +--rw common
          +--rw route-distinguisher? string
          +--rw vpn-targets* [rt-value]
            +--rw rt-value string
            +--rw rt-type bgp-rt-type
          ......
    +--rw ipv6-family
      +--rw bgp-parameters
        +--rw common
          +--rw route-distinguisher? string
          +--rw vpn-targets* [rt-value]
            +--rw rt-value string
            +--rw rt-type bgp-rt-type
          ......

L3VPN interface parameters can reuse those parameters defined by [I-D.ietf-netmod-routing-cfg].

BGP Protocols parameters for L3VPN is defined by the draft [I-D.ietf-idr-bgp-model]. The augment may be defined in the future version if necessary.

3.2. VPN Instance Configuration

An instance is created to comprise the VPN forwarding information for each VPN in a BGP/MPLS IP VPN. This instance is called a VPN instance or a VPN routing and forwarding (VRF) table. It is also called a per-site forwarding table in [RFC4364]. VPN instances must be created in all BGP/MPLS IP VPN solutions. VPN instances support both the IPv4 and IPv6 address families.

VPN instance configuration consists of the following components:

- Per-Instance Configuration: that contains the common writable configuration objects for VPN instance IPv4 and IPv6 address family.

- Address Family Configuration of L3VPN Instance: that contains the address family specific writable configuration objects.

3.2.1. Per-Instance Configuration

Per-instance parameters is defined by [I-D.ietf-netmod-routing-cfg] including instance name, description, etc.

3.2.2. Address Family Configuration of L3VPN Instance

l3vpn container contains the address family specific writable configuration objects, such as route-distinguisher, vpn-targets, apply-label-mode, etc. The parameters should be consistent between IPv4 family and IPv6 family.
### 3.3. Yang Tree of L3VPN Yang Model

The Yang tree of L3VPN Yang model is shown in the following figure:

```yang
module: ietf-l3vpn
augment /rt:routing/rt:routing-instance:
  +--rw l3vpn
    |  +--rw ipv4-family
    |     |  +--rw bgp-parameters
    |     |     |  +--rw common
    |     |     |     |  +--rw route-distinguisher? string
    |     |     |     |  +--rw vpn-targets* [rt-value]
    |     |     |     |     |  +--rw rt-value string
    |     |     |     |     |  +--rw rt-type bgp-rt-type
    |     |     |     |  +--rw apply-label-mode? apply-label-mode-def
    |     |     |  +--rw import-route-policy? string
    |     |  +--rw export-route-policy? string
    |     |  +--rw tunnel-policy? string
    |     |  +--rw prefix-limit
    |     |     |  +--rw prefix-limit-number? uint32
    |     |     |  +--rw (prefix-limit-action)?
    |     |     |     |  ---:(enable-alert-percent)
    |     |     |     |     |  +--rw alert-percent-value? uint8
    |     |     |     |     |  +--rw route-unchanged? boolean
    |     |     |     |  ---:(enable-simple-alert)
    |     |     |     |     |  +--rw simple-alert? boolean
    |     |  +--rw routing-table-limit
    |     |     |  +--rw routing-table-limit-number? uint32
    |     |     |  +--rw (routing-table-limit-action)?
    |     |     |     |  ---:(enable-alert-percent)
    |     |     |     |     |  +--rw alert-percent-value? uint8
    |     |     |     |  ---:(enable-simple-alert)
    |     |     |     |     |  +--rw simple-alert? boolean
    |     |  +--rw import-global-rib
    |     |     |  +--rw protocol? enumeration
    |     |     |  +--rw processId? uint32
    |     |     |  +--rw bgp-valid-route? boolean
    |     |     |  +--rw route-policy-name? string
    |     |  +--rw ipv6-family
    |  ......
```yaml
        +--rw rt-type  bgp-rt-type
  +--rw apply-label-mode?  apply-label-mode-def
  +--rw import-route-policy?  string
  +--rw export-route-policy?  string
  +--rw tunnel-policy?  string
  +--rw prefix-limit
    +--rw prefix-limit-number?  uint32
    +--rw (prefix-limit-action)?
      +--:(enable-alert-percent)
        |  +--rw alert-percent-value?  uint8
        |  +--rw route-unchanged?  boolean
      +--:(enable-simple-alert)
        +--rw simple-alert?  boolean
  +--rw routing-table-limit
    +--rw routing-table-limit-number?  uint32
    +--rw (routing-table-limit-action)?
      +--:(enable-alert-percent)
