Yang Data Model for DHCP Protocol
draft-liu-dhc-dhcp-yang-model-07.txt

Abstract

This document defines a YANG data model for DHCP Server, relay, and client, including configuration and running state.

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/1id-abstracts.txt

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html

This Internet-Draft will expire on April 12, 2009.

Liu, Ed. & Lou & Chen Expires April 12, 2019 [Page 1]
1. Introduction

This document defines a YANG [RFC6020] data model that can be used to configure and manage DHCP.

This data model includes configuration data and state data, in which DHCP server, relay, and client nodes are defined.

1.1. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119].

The following terms are used within this document:

The following terms are defined in [RFC6241] and are not redefined here:

- client
- configuration data
- server
The following terms are defined in [RFC6020] and are not redefined here:

- augment
- data model
- data node
- presence container

1.2. Tree Diagrams

A simplified graphical representation of the data model is used in this document. The meaning of the symbols in these diagrams is as follows:

- Brackets "[" and "]" enclose list keys.
- Abbreviations before data node names: "rw" means configuration (read-write), and "ro" means state data (read-only).
- Symbols after data node names: "?" means an optional node, "!" means a presence container, and "*" denotes a list and leaf-list.
- Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").
- Ellipsis ("...") stands for contents of subtrees that are not shown.

2. Design of Data Model

The goal of this document is to define a data model that provides a common user interface to the DHCP protocol. There is very information that is designated as "mandatory", providing freedom for vendors to adapt this data model to their respective product implementations.

2.1. Overview

The overall structure of the model is described as the following.

```
module: ietf-dhcp
  +--rw dhcp
    |   +--rw server
    |     |   ...
    |     |     ...
    |     +--rw relay
```
Furthermore, design three if-feature for deployment of DHCP server/relay/client as below:

```yang
feature dhcp-server {
  description "Feature DHCP server";
}

feature dhcp-client {
  description "Feature DHCP client";
}

feature dhcp-relay {
  description "Feature DHCP relay";
}
```

### 2.2. DHCP Server

Server contain the configuration items, including lease time, ping packet, IP address pool, option. And also include the operational data for server.

The most important part is the IP pool configuration. Specifying IP address section is for dynamic allocation. Configuring the mapping between IP address and MAC address is for manual allocation.

```yang
module: ietf-dhcp

++-rw server {server}? 
  ++-rw lease-time?         uint32 
  ++-rw ping-packet-number? uint8 
  ++-rw ping-packet-timeout? uint16 
  ++-rw option 
    ++-rw dhcp-server-identifier?   inet:ip-address 
    ++-rw domain-name?             string 
    ++-rw domain-name-server?      inet:ip-address 
    ++-rw interface-mtu?           uint32 
    ++-rw netbios-name-server?     inet:ip-address 
    ++-rw netbios-node-type?       uint32 
    ++-rw netbios-scope?           string 
    ++-rw ip-pool* [ip-pool-name] 
      ++-rw ip-pool-name           string 
      ++-rw interface?             if:interface-ref 
      ++-rw gateway-ip?            inet:ip-address 
```
2.3. DHCP Relay

The relay function is configured per interface. Enable/disable relay functionality on a specific interface, and specify the DHCP server.

module: ietf-dhcp
2.4. DHCP Client

DHCP client is also managed per interface, including enable/disable client DHCP client function, client id and lease time. The packet statistics for the DHCP client is also included.
...  
  +--rw client {client}?  
  +--rw interfaces* [interface]  
    +--rw interface if:interface-ref  
    +--rw client-id? string  
    +--rw lease? uint32  
  +--ro packet-statistics  
    +--x clean-statistics  
    +--ro receive  
      |  +--ro offer-packet? uint32  
      |  +--ro ack-packet? uint32  
      |  +--ro nack-packet? uint32  
    +--ro send  
      |  +--ro decline-packet? uint32  
      |  +--ro discover-packet? uint32  
      |  +--ro request-packet? uint32  
      +--ro release-packet? uint32  
      +--ro inform-packet? uint32

3. DHCP YANG Module

4. Security Considerations

The data model defined does not create any security implications.

5. Contributors

The following people all contributed significantly to the initial YANG model:

- Gang Yan (Huawei)
- Hongying Sheng (Ericsson)

6. IANA Considerations

This draft does not request any IANA action.
7. Normative References
