Abstract

This document defines a YANG data model that can be used to configure and manage Segment Routing TE extensions in BGP.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 8, 2020.

1. Introduction

YANG [RFC6020] is a data definition language that was introduced to define the contents of a conceptual data store that allows networked devices to be managed using NETCONF [RFC6241]. YANG is proving relevant beyond its initial confines, as bindings to other interfaces (e.g. ReST) [RFC8040] and encodings other than XML (e.g. JSON) [RFC7951] are being defined. Furthermore, YANG data models can be used as the basis of implementation for other interfaces, such as CLI and programmatic APIs.
This document defines the YANG model for Segment Routing TE specific extensions in BGP.

1.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

2. BGP Segment Routing Traffic Engineering Yang model

2.1. Overview

Segment Routing (SR), as defined in [RFC8402], leverages the source routing paradigm where a node steers a packet through an ordered list of instructions, called segments. SR, thus, allows enforcing a flow through any topological path and/or service chain while maintaining per-flow state only at the ingress nodes to the SR domain.

When applied to ipv6 data-plane (i.e. SRv6), the ordered set of instructions are realized via SRv6 SIDs. The various functions and behaviors corresponding to network programming using SRv6 are specified in [I-D.ietf-spring-srv6-network-programming].

This document defines Yang model for the Segment Routing TE extensions applicable for BGP as following:

- BGP signaled SR Policy as described in [I-D.ietf-idr-segment-routing-te-policy].
- Automatic Steering as described in [I-D.ietf-spring-segment-routing-policy] and [I-D.ietf-idr-segment-routing-te-policy].

The Yang extensions proposed in this model augment the base BGP model defined in [I-D.ietf-idr-bgp-model].

Note: Base BGP model does not have a common structure for BGP RIB. The placeholder containers defined in this model can be removed once base BGP model has the BGP RIB structure.

The modeling in this document complies with the Network Management Datastore Architecture (NMDA) [RFC8342]. The operational state data is combined with the associated configuration data in the same hierarchy [RFC8407]. When protocol states are retrieved from the NMDA operational state datastore, the returned states cover all
Internet-Draft    Yang Model for BGP Segment Routing TE        July 2019

"config true" (rw) and "config false" (ro) nodes defined in the schema.

2.2. SR Policy

Architecture for SR Policies is described in [I-D.ietf-spring-segment-routing-policy]. BGP Signaled SR Policies are described in the [I-D.ietf-idr-segment-routing-te-policy]. Following Yang extensions for SR Policy configuration and state data are applicable:

- Addition of identities extending the BGP-AFI-SAFI base identity. This is to add two new address families namely IPv4 SR-policy and IPv6 SR-policy, as described in [I-D.ietf-idr-segment-routing-te-policy].

- BGP Signaled SR Policy candidate paths. These refer to the explicit candidate paths signaled via BGP as SAFI NLRIs, state of which is applicable in the context of BGP speaker process. This is modeled by adding SR Policy address family specific container under generic BGP afi-safi list entry defined in the base BGP model [I-D.ietf-idr-bgp-model].

- On Demand SR Policy candidate paths. These refer to the dynamic candidate paths as described in [I-D.ietf-spring-segment-routing-policy]. There are two parts to this in the context of BGP. A set of authorized SR Policy colors for on demand policy triggers, and the actual instantiated candidate paths per BGP next-hop. New containers and lists are added under BGP global mode to model this information.

- SR Policy state in the context of BGP speaker. This represents the state SR Policies (regardless of method of instantiation per candidate path). The SR Policy state is maintained in the context of BGP speaker process to realize the Automatic Steering of overlay routes. Automatic Steering extensions are described in the next section.

Note: The common parameters and datatypes for the SR Policy, currently defined in this model, should be imported from SR Policy Manager model, once available.

2.3. Automatic Steering

Automatic Steering (AS) refers to the ability to forward traffic over a SR Policy on the head-end, as described in [I-D.ietf-spring-segment-routing-policy]. When a BGP route is received with the color extended community and if the color value
matches the color of an authorized SR Policy installed on the head-end, the route is programmed to resolve over SR Policy in forwarding. Automatic Steering information associated with the BGP routes is modeled as state information per route.

TBD: The configuration parameters for Automatic Steering are yet to be added as an augmentation to the BGP route policy model. Such as, extensions for opaque color extended community in BGP policy model, and the Color Only (CO) flags controlling the Automatic Steering behavior as described in [I-D.ietf-idr-segment-routing-te-policy].

3. Yang Tree

3.1. SR Policy

6. IANA Considerations

7. Security Considerations

The transport protocol used for sending the BGP Segment Routing data MUST support authentication and SHOULD support encryption. The data-model by itself does not create any security implications.

This draft does not change any underlying security issues inherent in [I-D.ietf-idr-bgp-model].

8. Acknowledgements

TBD.
