Definitions of Textual Conventions (TCs) for Multiprotocol Label Switching (MPLS) Management
draft-manral-mpls-rfc3811bis-01

Abstract

This memo defines a Management Information Base (MIB) module which contains Textual Conventions to represent commonly used Multiprotocol Label Switching (MPLS) management information. The intent is that these TEXTUAL CONVENTIONS (TCs) will be imported and used in MPLS related MIB modules that would otherwise define their own representations. This document obsoletes RFC3811 as it addresses the need to support IPv6 extended TunnelID’s by defining a new TC-MplsNewExtendedTunnelID which suggests using IPv4 address of the ingress or egress LSR for the tunnel for an IPv6 network.

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on February 3, 2013.

1. Introduction

This document defines a MIB module which contains Textual Conventions for Multiprotocol Label Switching (MPLS) networks. These Textual Conventions should be imported by MIB modules which manage MPLS networks.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

For an introduction to the concepts of MPLS, see [RFC3031].

2. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to Section 7 of [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIv2, which is described in STD 58 ([RFC2578], [RFC2579], and [RFC2580]).

3. MPLS Textual Conventions MIB Definitions

MPLS-TC-STD-MIB DEFINITIONS ::= BEGIN

This MIB module defines TEXTUAL-CONVENTIONs for concepts used in Multiprotocol Label Switching (MPLS) networks.

Changes from RFC3811 - MplsExtendedTunnelId

REVISION "200809080000Z" -- 8 September, 2008

DESCRIPTION
"Initial version published as part of Internet Draft. To be published as RFC XXXX"

-- RFC Ed.: RFC-editor pleases fill in XXXX

::= { mplsStdMIB 1 }

mplsStdMIB OBJECT IDENTIFIER

 ::= { transmission 166 }

MplsAtmVcIdentifier ::= TEXTUAL-CONVENTION
DISPLAY-HINT "d"
STATUS current

DESCRIPTION
"A Label Switching Router (LSR) that creates LDP sessions on ATM interfaces uses the VCI or VPI/VCI field to hold the LDP Label.

VCI values MUST NOT be in the 0-31 range. The values 0 to 31 are reserved for other uses by the ITU and ATM Forum. The value of 32 can only be used for the Control VC, although values greater than 32 could be configured for the Control VC.

If a value from 0 to 31 is used for a VCI
the management entity controlling the LDP subsystem should reject this with an inconsistentValue error. Also, if the value of 32 is used for a VC which is NOT the Control VC, this should result in an inconsistentValue error.

REFERENCE
"MPLS using LDP and ATM VC Switching, RFC3035."

SYNTAX  Integer32 (32..65535)

Figure 1

MplsBitRate ::= TEXTUAL-CONVENTION
DISPLAY-HINT "d"
STATUS      current
DESCRIPTION
"If the value of this object is greater than zero, then this represents the bandwidth of this MPLS interface (or Label Switched Path) in units of '1,000 bits per second'.

The value, when greater than zero, represents the bandwidth of this MPLS interface (rounded to the nearest 1,000) in units of 1,000 bits per second. If the bandwidth of the MPLS interface is between ((n * 1000) - 500) and ((n * 1000) + 499), the value of this object is n, such that n > 0.

If the value of this object is 0 (zero), this means that the traffic over this MPLS interface is considered to be best effort."
SYNTAX  Unsigned32 (0|1..4294967295)

MplsBurstSize ::= TEXTUAL-CONVENTION
DISPLAY-HINT "d"
STATUS      current
DESCRIPTION
"The number of octets of MPLS data that the stream may send back-to-back without concern for policing. The value of zero indicates that an implementation does not support Burst Size."
SYNTAX  Unsigned32 (0..4294967295)

MplsExtendedTunnelId ::= TEXTUAL-CONVENTION
STATUS      obsolete
DESCRIPTION
"A unique identifier for an MPLS Tunnel. This may represent an IPv4 address of the ingress or egress LSR for the tunnel. This value is derived from the Extended Tunnel Id in RSVP or the Ingress Router ID for CR-LDP."

REFERENCE
"RSVP-TE: Extensions to RSVP for LSP Tunnels, [RFC3209]."

Constraint-Based LSP Setup using LDP, [RFC3212]."

SYNTAX
Unsigned32(0..4294967295)

MplsLabel ::= TEXTUAL-CONVENTION
STATUS current

DESCRIPTION
"This value represents an MPLS label as defined in
[RFC3031], [RFC3032], [RFC3034], [RFC3035] and
[RFC3471].

The label contents are specific to the label being represented, such as:

* The label carried in an MPLS shim header
  (for LDP this is the Generic Label) is a 20-bit
  number represented by 4 octets. Bits 0-19 contain
  a label or a reserved label value. Bits 20-31
  MUST be zero.

The following is quoted directly from [RFC3032].
There are several reserved label values:

i. A value of 0 represents the
  ‘IPv4 Explicit NULL Label’. This label value is only legal at the bottom of the
  label stack. It indicates that the label stack must be popped, and the forwarding
  of the packet must then be based on the IPv4 header.

ii. A value of 1 represents the
    ‘Router Alert Label’. This label value is
    legal anywhere in the label stack except at
    the bottom. When a received packet
    contains this label value at the top of
    the label stack, it is delivered to a
    local software module for processing.
    The actual forwarding of the packet
is determined by the label beneath it in the stack. However, if the packet is forwarded further, the Router Alert Label should be pushed back onto the label stack before forwarding. The use of this label is analogous to the use of the 'Router Alert Option' in IP packets [RFC2113]. Since this label cannot occur at the bottom of the stack, it is not associated with a particular network layer protocol.

iii. A value of 2 represents the 'IPv6 Explicit NULL Label'. This label value is only legal at the bottom of the label stack. It indicates that the label stack must be popped, and the forwarding of the packet must then be based on the IPv6 header.

iv. A value of 3 represents the 'Implicit NULL Label'. This is a label that an LSR may assign and distribute, but which never actually appears in the encapsulation. When an LSR would otherwise replace the label at the top of the stack with a new label, but the new label is 'Implicit NULL', the LSR will pop the stack instead of doing the replacement. Although this value may never appear in the encapsulation, it needs to be specified in the Label Distribution Protocol, so a value is reserved.

v. Values 4-15 are reserved.

* The frame relay label can be either 10-bits or 23-bits depending on the DLCI field size and the upper 22-bits or upper 9-bits must be zero, respectively.

* For an ATM label the lower 16-bits represents the VCI, the next 12-bits represents the VPI and the remaining bits MUST be zero.

* The Generalized-MPLS (GMPLS) label contains a value greater than 2^24-1 and used in GMPLS.
as defined in [RFC3471]."

SYNTAX  INTEGER {
  generic(1),
  atm(2),
  frameRelay(3)
}

MplsLSPID ::= TEXTUAL-CONVENTION
STATUS       current
DESCRIPTION
"A unique identifier within an MPLS network that is assigned to each LSP. This is assigned at the head end of the LSP and can be used by all LSRs to identify this LSP. This value is piggybacked by the signaling protocol when this LSP is signaled within the network. This identifier can then be used at each LSR to identify which labels are being swapped to other labels for this LSP. This object can also be used to disambiguate LSPs that share the same RSVP sessions between the same source and destination.

For LSPs established using CR-LDP, the LSPID is composed of the ingress LSR Router ID (or any of its own IPv4 addresses) and a locally unique CR-LSP ID to that LSR. The first two bytes carry the CR-LSPID, and the remaining 4 bytes carry the Router ID. The LSPID is useful in network management, in CR-LSP repair, and in using an already established CR-LSP as a hop in an ER-TLV.
For LSPs signaled using RSVP-TE, the LSP ID is defined as a 16-bit (2 byte) identifier used in the SENDER_TEMPLATE and the FILTER_SPEC that can be changed to allow a sender to share resources with itself. The length of this object should only be 2 or 6 bytes. If the length of this octet string is 2 bytes, then it must identify an RSVP-TE LSPID, or it is 6 bytes, it must contain a CR-LDP LSPID.

Values greater than 0, but less than or equal to 65535, should be used to indicate signaled (or backup) tunnel LSP instances. For tunnel LSPs signaled using RSVP, this value should correspond to the RSVP LSP ID used for the RSVP-TE LSP. Values greater than 65535 apply to FRR detour instances."
SYNTAX  Unsigned32(0|1..65535|65536..4294967295)

TeHopAddressType ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION "A value that represents a type of address for a Traffic Engineered (TE) Tunnel hop."
unknown(0)   An unknown address type. This value MUST be used if the value of the corresponding TeHopAddress object is a zero-length string. It may also be used to indicate a TeHopAddress which is not in one of the formats defined below.

ipv4(1)      An IPv4 network address as defined by the InetAddressIPv4 TEXTUAL-CONVENTION [RFC3291].

ipv6(2)      A global IPv6 address as defined by the InetAddressIPv6 TEXTUAL-CONVENTION [RFC3291].

asnumber(3)  An Autonomous System (AS) number as defined by the TeHopAddressAS TEXTUAL-CONVENTION.

unnum(4)     An unnumbered interface index as defined by the TeHopAddressUnnum TEXTUAL-CONVENTION.

lspid(5)     An LSP ID for TE Tunnels (RFC3212) as defined by the MplsLSPID TEXTUAL-CONVENTION.

Each definition of a concrete TeHopAddressType value must be accompanied by a definition of a TEXTUAL-CONVENTION for use with that TeHopAddress.

To support future extensions, the TeHopAddressType TEXTUAL-CONVENTION SHOULD NOT be sub-typed in object type definitions. It MAY be sub-typed in compliance statements in order to require only a subset of these address types for a compliant implementation.

Implementations must ensure that TeHopAddressType objects and any dependent objects (e.g., TeHopAddress objects) are consistent. An inconsistentValue error must be generated if an attempt to change a TeHopAddressType object would, for example, lead to an undefined TeHopAddress value that is not defined herein. In particular,
TeHopAddressType/TeHopAddress pairs must be changed together if the address type changes (e.g., from ipv6(2) to ipv4(1)).

SYNTAX     INTEGER {
unknown(0),
ipv4(1),
ipv6(2),
asnumber(3),
unnum(4),
lspid(5)
}

TeHopAddress ::= TEXTUAL-CONVENTION

STATUS     current

DESCRIPTION
"Denotes a generic Tunnel hop address, that is, the address of a node which an LSP traverses, including the source and destination nodes. An address may be very concrete, for example, an IPv4 host address (i.e., with prefix length 32); if this IPv4 address is an interface address, then that particular interface must be traversed. An address may also specify an ‘abstract node’, for example, an IPv4 address with prefix length less than 32, in which case, the LSP can traverse any node whose address falls in that range. An address may also specify an Autonomous System (AS), in which case the LSP can traverse any node that falls within that AS.

A TeHopAddress value is always interpreted within the context of an TeHopAddressType value. Every usage of the TeHopAddress TEXTUAL-CONVENTION
is required to specify the TeHopAddressType object which provides the context. It is suggested that the TeHopAddressType object is logically registered before the object(s) which use the TeHopAddress TEXTUAL-CONVENTION if they appear in the same logical row.

The value of a TeHopAddress object must always be consistent with the value of the associated TeHopAddressType object. Attempts to set a TeHopAddress object to a value which is inconsistent with the associated TeHopAddressType must fail with an inconsistentValue error.

SYNTAX OCTET STRING (SIZE (0..32))

TeHopAddressAS ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION "Represents a two or four octet AS number. The AS number is represented in network byte order (MSB first). A two-octet AS number has the two MSB octets set to zero."
REFERENCE "Textual Conventions for Internet Network Addresses, [RFC3291]. The InetAutonomousSystemsNumber TEXTUAL-CONVENTION has a SYNTAX of Unsigned32, whereas this TC has a SYNTAX of OCTET STRING (SIZE (4)). Both TCs represent an autonomous system number but use different syntaxes to do so."

Constraint-Based LSP Setup using LDP, [RFC3212]."
SYNTAX OCTET STRING(SIZE(16))
END

Figure 6

4. Effect of the new TC

The new TC definition for the MPLS Tunnel will have an effect on the MPLS-TE-MIB and MPLS-TC-STD-MIB. Also the following RFC’s which use the MIB may have to be updated to accommodate the changed definition: [RFC3209], [RFC3812], [RFC3813], [RFC3212], [RFC4368], [RFC3814], [RFC3815], and [RFC6639].

5. Contributors

This MIB fixes a small issue with the earlier version of this MIB as defined in RFC3811. The earlier document was created by combining TEXTUAL-CONVENTIONS from current MPLS MIBs and a TE-WG MIB. Co-authors on each of these MIBs contributed to the TEXTUAL-CONVENTIONS contained in this MIB and also contributed greatly to the revisions of this document. These co-authors are:

Rajiv Papneja
Huawei Technologies
2330 Central Expressway
Santa Clara, CA  95050
USA

Email: rajiv.papneja@huawei.com

Cheenu Srinivasan
Bloomberg L.P.
6. Acknowledgements

The author would like to thank Adrian Farrel and Thomas Nadeau for their guidance. The earlier editors and contributors would like to thank Mike MacFadden and Adrian Farrel for their helpful comments on several reviews. Also, a special acknowledgement to Bert Wijnen for his many detailed reviews. Bert’s assistance and guidance is greatly appreciated.

7. Security Considerations

This module does not define any management objects. Instead, it defines a set of textual conventions which may be used by other MPLS MIB modules to define management objects.

Meaningful security considerations can only be written in the MIB modules that define management objects. Therefore, this document has no impact on the security of the Internet.

8. IANA Considerations

IANA has made a MIB OID assignment under the transmission branch, that is, assigned the mplsStdMIB under { transmission 166 }. This sub-id is requested because 166 is the ifType for mpls(166) and is available under transmission.

In the future, MPLS related standards track MIB modules should be rooted under the mplsStdMIB subtree. The IANA is requested to manage that namespace. New assignments can only be made via a Standards Action as specified in [RFC2434].

The IANA has also assigned { mplsStdMIB 1 } to the MPLS-TC-STD-MIB specified in this document.
