XMSS public key algorithms for the Secure Shell (SSH) protocol
draft-mu-curdle-ssh-xmss-00

Abstract

This document describes the use of the XMSS (XMSS: eXtended Merkle
Signature Scheme) which is resistant to quantum computers attack, as
a digital signature algorithm in the Secure Shell (SSH) protocol.

Status of This Memo

This Internet-Draft is submitted in full conformance with the
provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering
Task Force (IETF). Note that other groups may also distribute
working documents as Internet-Drafts. The list of current Internet-
Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months
and may be updated, replaced, or obsoleted by other documents at any
time. It is inappropriate to use Internet-Drafts as reference
material or to cite them other than as "work in progress."

This Internet-Draft will expire on April 29, 2020.

publication of this document. Please review these documents
carefully, as they describe your rights and restrictions with respect
to this document. Code Components extracted from this document must
include Simplified BSD License text as described in Section 4.e of
the Trust Legal Provisions and are provided without warranty as
described in the Simplified BSD License.
1. Introduction

Secure Shell (SSH) [RFC4251] is a secure remote-login protocol. It provides for an extensible variety of public key algorithms for identifying servers and users to one another. XMSS [RFC8391] is a digital signature system. OpenSSH 7.7 [OpenSSH-7.7] introduced support for using XMSS for server and user authentication and was then followed by other SSH implementations.

This document describes the method implemented by OpenSSH and others, and formalizes its use of the name "ssh-xmss".

[TO BE REMOVED: Please send comments on this draft to curdle@ietf.org.]
5. Signature Algorithm

Signatures are generated according to the procedure in [RFC8391], Section 4.1.8 [RFC8391].

6. Signature Format

The "ssh-xmss" key format has the following encoding:

```plaintext
string "ssh-xmss"
string signature
```

Here 'signature' is the 64-octet signature produced in accordance with [RFC8391], Section 4.1.9 [RFC8391].

7. Verification Algorithm

XMSS signatures are verified according to the procedure in [RFC8391], Section 4.1.10 [RFC8391].

8. SSHFP DNS resource records

Usage and generation of SSHFP DNS resource record is described in [RFC4255]. This section illustrates the generation of SSHFP resource records for "ssh-xmss" keys and the document specifies the corresponding xmss code point to the "SSHFP RR Types for public key algorithms" IANA registry.

The generation of SSHFP resource records for "ssh-xmss" keys is described as follows.

The encoding of xmss public keys is described in [RFC8391]. In brief, an xmss public key is a 57-octet value representing a 455-bit y-coordinate of an elliptic curve point, and a sign bit indicating the corresponding x-coordinate.

The SSHFP Resource Record for the xmss public key with SHA-256 fingerprint would for example be:

```plaintext
example.com. IN SSHFP TBD 2 ( a87f1b687ac0e57d2a081a2f2826723 34d90ed316d2b818ca9580ea384d924 01 )
```

The 2 here indicates SHA-256 [RFC6594].
9. IANA Considerations

This document augments the Public Key Algorithm Names in [RFC4250], Section 4.6.2 [RFC4250].

IANA is requested to add to the Public Key Algorithm Names registry [IANA-PKA] with the following entry:

<table>
<thead>
<tr>
<th>Public Key Algorithm Name Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssh-xmss</td>
</tr>
<tr>
<td>This Draft</td>
</tr>
</tbody>
</table>

IANA is requested to add the following entry to the "SSHFP RR Types for public key algorithms" registry [IANA-SSHFP]:

+--------+-------------+------------+
| Value   | Description | Reference  |
+--------+-------------+------------+
| TBD     | xmss        | [this-draft] |

We strongly suggest 5 as value.

[TO BE REMOVED: This registration should take place at the following location: <http://www.iana.org/assignments/ssh-parameters/ssh-parameters.xhtml#ssh-parameters-19>]

10. Security Considerations

The security considerations in [RFC4251], Section 9 [RFC4251] apply to all SSH implementations, including those using xmss.

The security considerations in [RFC8391], Section 8 [RFC8391] apply to all uses of xmss including those in SSH.

11. Acknowledgements

The OpenSSH implementation of XMSS in SSH was written by Markus Friedl. We are also grateful to Daniel Migault for their comments.
