DNS over HTTP resolver announcement Using DHCP or Router Advertisements
draft-peterson-doh-dhcp-01

Abstract

This specification describes a DHCP option and Router Advertisement
(RA) extension to inform clients of the presence of a DNS over HTTP
(DoH) service to be used for DNS queries.

Status of This Memo

This Internet-Draft is submitted in full conformance with the
provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering
Task Force (IETF). Note that other groups may also distribute
working documents as Internet-Drafts. The list of current Internet-
Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months
and may be updated, replaced, or obsoleted by other documents at any
time. It is inappropriate to use Internet-Drafts as reference
material or to cite them other than as "work in progress."

This Internet-Draft will expire on April 22, 2020.

publication of this document. Please review these documents
carefully, as they describe your rights and restrictions with respect
to this document. Code Components extracted from this document must
include Simplified BSD License text as described in Section 4.e of
the Trust Legal Provisions and are provided without warranty as
described in the Simplified BSD License.
1. Introduction

DHCPv4 [RFC2131], DHCPv6 [RFC3646], and IPv6 Router Announcements [RFC8106] all provide means to inform clients of available resolvers using the incumbent DNS protocol for querying, however there is no means of specifying alternate protocols to perform DNS queries.

2. Conventions and Definitions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

3. The DoH Option

The DoH DHCP/RA option informs the client that a DoH service is available for use for answering DNS queries. In order to support multiple "classes" of clients, the network operator can provide the URI template [RFC6570] which describes how a client can construct the URL to use for resolution. Whilst DoH servers may support multiple URI Templates, only one template MUST be transmitted.

URI Templates that contain a host name SHOULD only be sent where a DHCP server or Router provide name servers, as name resolution of any host name in the template will require clients to use the non-DoH servers provided or manual configuration. URI Templates that are over 255 bytes in length MUST implement long option encoding as defined in [RFC3396].
3.1. IPv4 DHCP Option

The format of the IPv4 DoH DHCP option is shown below.

```
+-----------------+-----------------+-----------------+-----------------+
|     Code       |     Length     |      URI Template | .               |
+-----------------+-----------------+-----------------+-----------------+
```

Code: The DoH DHCPv4 option (one octet).
Length: The length, in octets of the URI template.
URI Template: The DoH server available, encoded following the rules of [RFC3986].

3.2. IPv6 DHCP Option

The format of the IPv6 DHCP option is shown below.

```
+-----------------+-----------------+-----------------+-----------------+
|          option-code         |           option-len          |
+-----------------+-----------------+-----------------+-----------------+
```

option-code: TODO (two octets)
option-len: The length, in octects of the URI Template.
URI Template: The DoH server

3.3. The DoH IPv6 RA Option

The format of the DoH Router Advertisement option is shown below.

0                   1                   2                   3
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|     Type      |     Length    |      URI Template             |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
Type: TODO (one octet)
Length: 8-bit unsigned integer representing the entire length of all fields, in units of 8 bytes.
URI Template: The DoH server available for use. This should be padded with NULL (0x0) to make the total option length (including the Type and Length fields) a multiple of 8 bytes.

4. Security Considerations

An attacker with the ability to inject DHCP messages could include this option and present a malicious resolver.

TODO: Further risk and threat assessments.

5. IANA Considerations

TODO: This section must be updated after assignments have been issued.

This document requires the assignment of an option code assigned under the "BOOTP Vendor Extensions and DHCP Options" [bootp-registry], in addition to an option code assigned under the "Option Codes" registry under DHCPv6 parameters [dhcpv6-registry].

Also, an assignment for an IPv6 RA Option Type from the "IPv6 Neighbor Discovery Option Formats" registry under ICMPv6 parameters [icmpv6-registry].

6. References

6.1. Normative References

6.2. Informative References
