YANG Data Model for Segment Routing Policy
draft-raza-spring-sr-policy-yang-01.txt

Abstract

This document defines a YANG data model for Segment Routing (SR) Policy that can be used for configuring, instantiating, and managing SR policies. The model is generic and apply equally to the MPLS and SRv6 instantiations of SR policies.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 9, 2020.

1. Introduction

The Network Configuration Protocol (NETCONF) [RFC6241] defines mechanisms to manage network devices. YANG [RFC6020] is a modular language that represents data structures in an XML tree format, and is used as a data modeling language for the NETCONF.

Segment Routing (SR), as defined in [RFC8402], allows a headend node to steer a packet flow along any topological path and/or service chain. The headend node is said to steer a flow into a Segment Routing Policy (SR Policy). An SR policy is a framework [I-D.ietf-spring-segment-routing-policy] that enables instantiation of an ordered list of segments on a node for implementing a policy.
This document introduces a YANG data model for SR policy framework for instantiating, configuring and managing SR policies along with its attributes. It is also expected that other companion models, such as BGP SR Policy [I-D.ietf-idr-segment-routing-te-policy], will be defined and/or augmented accordingly in their respective areas.

This model defines the following constructs for managing an SR policy:

- Configuration
- Operational State
- Notifications
- Executables (Actions)

This document expects and requires the reader to be well familiar with the concepts and constructs of an SR policy [I-D.ietf-spring-segment-routing-policy] as well as the YANG modeling language and its presentation [RFC6020].

2. Specification of Requirements

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

3. Building Blocks

Before looking into the YANG model for SR policy, it is important to recall and highlight the major building blocks and constructs that constitute and contribute to an SR policy, as described in [I-D.ietf-spring-segment-routing-policy].

- policy: specifies constructs to allow a headend node to setup SR path(s) as an ordered list of segments for a given color and endpoint. The endpoint and the color are used to automate the steering of service or transport routes on an SR Policy. For a given headend, the key for an SR policy is (color, endpoint) where endpoint is an IP address that could be also NULL.

- candidate-path: is the unit for signalling of an SR Policy to a headend via protocols (such as PCEP, BGP, CLI etc.). A candidate path is either dynamic or explicit type, where an explicit candidate path is associated with one or more segment-lists and
dynamic candidate path expresses optimization objectives and set of constraints. An SR Policy is associated with one or more candidate paths and the preference of the candidate path is used to select the best candidate path for an SR Policy. A candidate path is valid if it is usable (e.g. when its constituents SIDs are reachable). An "active" candidate path is the selected path (for forwarding) that is valid and determined to be the best path of the SR Policy.

- segment-list: specifies ordered list of segments to traverse, where a segment can be specified in various forms (refer section 4 of [I-D.ietf-spring-segment-routing-policy]). The list is sorted by the index of the segment. A segment-list is used and referred by an explicit type of candidate-path.

- binding-sid: An SR policy is associated with a BSID to provide benefits of scaling, network opacity and service independence.

4. YANG Model

The modeling in this document complies with the Network Management Datastore Architecture (NMDA) [RFC8342]. The operational state data is combined with the associated configuration data in the same hierarchy [RFC8407]. When protocol states are retrieved from the NMDA operational state datastore, the returned states cover all "config true" (rw) and "config false" (ro) nodes defined in the schema.

For SR policy YANG specification, this document defines following new YANG modules:

<table>
<thead>
<tr>
<th>Module Name</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ietf-sr-policy-types</td>
<td>defines common and basic types related to an SR policy and related constructs</td>
</tr>
<tr>
<td>ietf-sr-policy</td>
<td>defines the model for SR policy instantiation, configuration, and management</td>
</tr>
</tbody>
</table>

4.1. Types and Definitions

SR policy common types and definitions are defined in the new module "ietf-sr-policy-types". The main types defined in this module include:
4.2. SR Policy

The base SR policy model is captured in ietf-sr-policy module. This base module augments "/rt:routing" and specifies the configuration,
operational state, executables/rpcs, and notification events required to manage SR policies.

The associated YANG specification for this module is captured in Section 6.2.

4.2.1. Configuration

In terms of configuration hierarchy, SR policy configuration tree has following two main areas:

- policy-attributes: container that defines common constructs that could be used across policies. Examples of such a construct include segment-lists, affinity-map etc. In future revision of this document, it is expected that this container will have more constructs defined.

- policies: container that defines list of policies with their attributes such as BSID, candidate-paths etc.

Following diagram depicts high level yang organization and hierarchy for an SR policy specification:
module: ietf-sr-policy
augment /rt:routing:
  +--rw segment-routing
  |    +--rw sr-policy
  |    |    +--rw policy-attributes
  |    |    |    +--rw affinity-map
  |    |    |    |    ....
  |    |    |    +--rw segment-lists
  |    |    |    |    segment-list* [name]
  |    |    |    |    |    segments
  |    |    |    |    |    segment* [index]
  |    |    |    |    |    |    ...
  |    |    |    +--rw explicit-binding-sid-rules
  |    |    |    |    ...
  |    |    +--rw policies
  |    |    policy* [color endpoint]
  |    |    |    +--+rw binding-sid
  |    |    |    |    ...
  |    |    |    +--rw candidate-paths
  |    |    |    candidate-path* [protocol origin discrim]
  |    |    |    |    +--+rw type
  |    |    |    |    |    +--rw explicit
  |    |    |    |    |    |    segment-lists
  |    |    |    |    |    |    segment-list* [ref]
  |    |    |    |    |    |    |    ...
  |    |    |    |    +--rw dynamic
  |    |    |    |    |    constraints
  |    |    |    |    |    |    ...

Figure 1: SR Policy - Hierarchy

Using the building blocks described in Section 3, following is the complete graphical representation of the data model for SR policy configuration:

data model: ietf-sr-policy
augment /rt:routing:
  +--rw segment-routing
  |    +--rw sr-policy
  |    |    +--rw policy-attributes

                    +++-rw disjointness-type? identityref
                    +++-rw subgroup-id? uint32

Please take note of the following important points in the above configuration model:

- This model supports both MPLS and SRv6 dataplane for SR -- i.e. items like segments and BSID can be defined as MPLS label or SRv6 SIDs.

- Specification of a segment supports all the types defined in SR policy base specification document.

- The above model supports explicit BSID specification on SR policy level as the main mode of specification. The model also allows explicit BSID per candidate-path as an if-feature capability that is optional for implementations.

- The above model will be extended in future revisions of this document to enhance constraints specification for dynamic type of candidate-path, as well as add traffic-steering controls.

4.2.2. State

As per NMDA model, the state related to configuration items specified in earlier Section 4.2.1 can be retrieved from the same tree. This section defines the other operational state items related to SR policy.

In addition to configured state, the operational state corresponding to the SR policy includes:

- policy operational state

- policy up/down timestamps

- policy BSID info such as alloc mode, actual value in-use, operational state, and forwarding stats

- Per candidate-path info such as:
  
  - Whether candidate-path is the best candidate-path
  
  - In case of non-best, the reason for such non-selection
  
  - Type of candidate-path - explicit or dynamic
  
  - Per segment-list information - such as validity of the segment-list, as well as forwarding state for a valid segment-list.
The forwarding state is represented in terms of per forwarding path info that includes next-hop address, outgoing interface, protection information, and encapsulation (label stack or SRv6 SID stack) etc.

Following is a simplified graphical representation of the data model for the SR policy (derived) operational state:

module: ietf-sr-policy
augment /rt:routing:
  +--rw segment-routing
    +--rw sr-policy
      +--rw policies
        +--rw policy* [color endpoint]
          +--rw color    uint32
          +--rw endpoint  inet:ip-address
          +--ro oper-state?  sr-policy-types:policy-oper-state
          +--ro transition-count?  uint32
          +--ro up-time?  yang:date-and-time
          +--ro down-time?  yang:date-and-time
        +--rw binding-sid
          +--ro alloc-mode?  sr-policy-types:binding-sid-alloc-mode
          +--ro allocated-sid?  sr-policy-types:sid-value-type
          +--ro oper-state?  sr-policy-types:binding-sid-oper-state
        +--ro counters
          +--ro pkts?  yang:counter64
          +--ro octets?  yang:counter64
        +--rw candidate-paths
          +--rw candidate-path* [protocol-origin originator discriminator]
            +--rw protocol-origin  sr-policy-types:protocol-origin-type
            +--rw originator        string
            +--rw discriminator      uint32
            +--ro is-best-candidate-path?  boolean
            +--ro non-selection-reason?  identityref
            +--ro is-valid?  boolean
            +--ro forwarding-paths
              +--ro forwarding-path* [path-id]
                +--ro path-id  uint8
                +--ro next-hop-address?  inet:ip-address
                +--ro next-hop-table-id?  uint32
                +--ro outgoing-interface?  if:interface-ref
                +--ro outgoing-sids
                  +--ro (dataplanetype)?
                    +--mpls
                      +--ro labels* [label]
                        +--ro label  rt-types:mpls-label
                      +--srv6

4.2.3. Notification

This model defines a list of notifications to inform an operator of important events detected regarding an SR policy. These events include events related to:

- Policy status: policy operational state changes
- Candidate-path active status and changes
- Explicit Binding SID collision/unavailability events

Following is a simplified graphical representation of the data model for SR policy notifications:

```
+--ro sids* [sid]
    |   +--ro sid    srv6-types:srv6-sid
    |       +--ro is-protected?   boolean
    |       +--ro is-pure-backup?  boolean
    |       +--ro backup-path-id?  uint8
    |       +--ro weight?         uint32
```

5. Pending Items

Following are the items that will be addressed in future revisions of
this document:
- Configuration and Specification of:
  * Traffic steering over SR policy
  * ODN templates
  * Spray policy
o Executables (RPC actions)

o Re-use and leverage common constructs from TE YANG specification.

6. YANG Specification

Following are actual YANG definition for the modules defined earlier in the document.

6.1. Types

7. Security Considerations

The configuration, state, and notification data defined using YANG data models in this document are likely to be accessed via the protocols such as NETCONF [RFC6241] etc.

Hence, YANG implementations MUST comply with the security requirements specified in section 15 of [RFC6020]. Additionally, NETCONF implementations MUST comply with the security requirements specified in sections 2.2, 2.3 and 9 of [RFC6241] as well as section 3.7 of [RFC8341].
8. IANA Considerations

This document requests the registration of the following URIs in the IETF "XML registry" [RFC3688]:

<table>
<thead>
<tr>
<th>URI</th>
<th>Registrant</th>
<th>XML</th>
</tr>
</thead>
<tbody>
<tr>
<td>urn:ietf:params:xml:ns:yang:ietf-sr-policy-types</td>
<td>The IESG</td>
<td>N/A</td>
</tr>
<tr>
<td>urn:ietf:params:xml:ns:yang:ietf-sr-policy</td>
<td>The IESG</td>
<td>N/A</td>
</tr>
</tbody>
</table>

This document requests the registration of the following YANG modules in the "YANG Module Names" registry [RFC6020]:

<table>
<thead>
<tr>
<th>Name</th>
<th>Namespace</th>
<th>Prefix</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>ietf-sr-policy-types</td>
<td>urn:ietf:params:xml:ns:yang:ietsr-policy-types</td>
<td>sr-policy-types</td>
<td>This document</td>
</tr>
<tr>
<td>ietf-sr-policy</td>
<td>urn:ietf:params:xml:ns:yang:ietsr-policy</td>
<td>sr-policy</td>
<td>This document</td>
</tr>
</tbody>
</table>

9. Acknowledgments

The authors of this document/YANG model would like to acknowledge the contributions/reviews by Johnson Thomas, Clarence Filsfils, Siva Sivabalan, Tarek Saad, Kris Michielsen, Dhanendra Jain, Ketan Talaulikar, Bhupendra Yadav, and Bruno Decraene.
