Abstract

This document describes a YANG data model for Segment Routing IPv6 (SRv6) base. The model serves as a base framework for configuring and managing an SRv6 subsystem and expected to be augmented by other SRv6 technology models accordingly. Additionally, this document also specifies the model for the SRv6 Static application.

The YANG modules in this document conform to the Network Management Datastore Architecture (NMDA).

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.
1. Introduction

The Network Configuration Protocol (NETCONF) [RFC6241] is one of the network management protocols that defines mechanisms to manage network devices. YANG [RFC6020] is a modular language that represents data structures in an XML tree format, and is used as a data modeling language for the NETCONF.

Segment Routing (SR), as defined in [RFC8402], leverages the source routing paradigm where a node steers a packet through an ordered list of instructions, called segments. SR, thus, allows enforcing a flow through any topological path and/or service chain while maintaining per-flow state only at the ingress nodes to the SR domain. When applied to ipv6 data-plane (i.e. SRv6), SR requires a type of routing header (SRH) in an IPv6 packet that is used to encode an ordered list of IPv6 addresses (SIDs). The active segment is indicated by the Destination Address of the packet, and the next segment is indicated by a pointer in the SRH [I-D.ietf-6man-segment-routing-header]. The various functions and behaviors corresponding to network programming using SRv6 are specified in [I-D.ietf-spring-srv6-network-programming].

This document introduces a YANG data model for base SRv6 that would serve as a base framework for configuring and managing an SRv6 subsystem. As needed, other SRv6 technology models (e.g. ISIS, OSPFv3, BGP, EVPN, Service Chaining) may augment this model. Furthermore, to illustrate basic behaviors as captured in [I-D.ietf-spring-srv6-network-programming], this document also specifies a YANG model for the SRv6-Static application.

The model currently defines the following constructs that are used for managing SRv6:

- Configuration
- Operational State
- Notifications

2. Specification of Requirements

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.
3. YANG Model

3.1. Overview

This document defines following three new YANG modules:

- ietf-srv6-types: defines common and basic types related to SRv6
- ietf-srv6-base: specifies management model for SRv6 base constructs (locator, SIDs, etc.)
- ietf-srv6-static: specifies management model for SRv6-static application

The modeling in this document complies with the Network Management Datastore Architecture (NMDA) defined in [RFC8342]. The operational state data is combined with the associated configuration data in the same hierarchy [RFC8407]. When protocol states are retrieved from the NMDA operational state datastore, the returned states cover all "config true" (rw) and "config false" (ro) nodes defined in the schema.

In this document, when a simplified graphical representation of YANG model is presented in a tree diagram, the meaning of the symbols in these tree diagrams is defined in [RFC8340].

3.2. SRv6 Types

SRv6 common types and definitions are defined in the new module "ietf-srv6-types". The main types defined in this module include:

- srv6-sid: SRv6 SID
- srv6-func-opcode: Typedef for FUNC opcode in an SRv6 SID
- srv6-func-opcode-reserved: Typedef for "reserved" FUNC opcode
- srv6-func-opcode-unreserved: Typedef for "unreserved" (allocatable) FUNC opcode
- srv6-func-opcode-reserved-type: Enum (list) of "reserved" FUNC opcode
- srv6-endpoint-type: SRv6 Endpoint behaviors [I-D.ietf-spring-srv6-network-programming] identity type
- srv6-transit-type: SRv6 Transit behavior types [I-D.ietf-spring-srv6-network-programming] enumeration
3.3. SRv6 Base

The base SRv6 model is specified in ietf-srv6-base module. This module augments "/rt:routing" and specifies the configuration, operational state, and notification events that are required to manage the base SRv6.

The corresponding YANG specification for this module is captured in Section 5.2.

3.3.1. Configuration

The module defines some fundamental items required to configure an SRv6 network:

- SRv6 Enablement: Enable Segment-Routing SRv6 feature
- Encapsulation Parameters: Provide encapsulation related parameters, such as source-address and ip-ttl-propagation, to be used when performing T.Encap*
- Locator(s) Specification: SRv6 locator is a fundamental construct for an SRv6 network. This is the construct from which SID (function opcodes) are allocated that on the local box, and advertised to and used by remote nodes for reachability. A locator is identified by a name and has associated prefix. It is possible to have more than one locator per node. In case of more than one locator, there is one and only one locator designated as the default locator.

Following is a simplified graphical tree representation of the data model for SRv6 base configuration.
module: ietf-srv6-base
augment /rt:routing:
  +--rw srv6
    +--rw enable?              boolean
    +--rw encapsulation
      |  +--rw source-address?       inet:ipv6-address
      |  +--rw ip-ttl-propagation?   boolean
    +--rw locators
      +--rw locator* [name]
        +--rw name                      string
        +--rw enable?                   boolean
        +--rw is-default                boolean
        +--rw prefix
        +--rw address    inet:ipv6-address
        +--rw length     srv6-types:srv6-locator-len

Figure 1: SRv6 Base - Config Tree

3.3.2. State

As per NMDA model, the state related to configuration items specified in above section Section 3.3.1 can be retrieved from the same tree. This section defines other operational state items related to SRv6 base.

The operational state corresponding to the SRv6 base includes:

- node capabilities: provides information on the node (hardware) capabilities and support regarding various SRv6 aspects and features including end behaviors, transit behaviors, security rules, counter/stats support, and other SRv6 parameters that need to be signaled in an SRv6 network by the protocols.

- locator: provides information related to a locator. The information includes locator operational state, and state of address conflict with any ipv6 address configured on local interfaces etc.

- local-sid: provides information related to local-SIDs allocated and/or installed on the node. This includes two types of information:
  1. aggregate across all local-SIDs such as aggregate counters
  2. per local-SID information such as allocation type (dynamic or explicit), SID owner protocol(s)/client(s), forwarding [paths] information, and stats/counters.
Following is a simplified graphical tree representation of the data model for the SRv6 operational state:

module: ietf-srv6-base
  augment /rt:routing:
    +--rw srv6
      +--rw locators
        |  +--rw locator* [name]
        |     +--rw name string
        |     +--ro operational-status? srv6-types:srv6-status-type
        |     +--ro is-in-address-conflict? boolean
      +--ro node-capabilities
        |  +--ro end-behavior* [type]
        |     +--ro type identityref
        |     +--ro supported boolean
        |  +--ro transit-behavior* [type]
        |     +--ro type srv6-types:srv6-transit-type
        |     +--ro supported boolean
        |  +--ro signaled-parameters
        |     +--ro max-sl? uint8
        |     +--ro max-end-pop-srh? uint8
        |     +--ro max-t_insert? uint8
        |     +--ro max-t_encap? uint8
        |     +--ro max-end_d? uint8
        |  +--ro security-rule* [type]
        |     +--ro type srv6-types:srv6-security-rule-type
        |     +--ro supported boolean
        |  +--ro counters* [type]
        |     +--ro type srv6-types:srv6-counter-type
        |     +--ro supported boolean
      +--ro local-sids
        +--ro counters
          |  +--ro cnt3
          |     +--ro in-pkts? yang:counter64
          |     +--ro in-octets? yang:counter64
        +--ro local-sid* [sid]
          |  +--ro sid srv6-types:srv6-sid
          |  +--ro is-reserved? boolean
          |  +--ro end-behavior-type? identityref
          |  +--ro alloc-type? srv6-types:sid-alloc-type
          |  +--ro owner* [type instance]
          |     +--ro type identityref
          |     +--ro instance string
          |     +--ro is-winner? boolean
          |     +--ro forwarding
          |     +--ro is-installed? boolean
This model defines a list of notifications to inform an operator of important events detected during the SRv6 operation. These events include events related to:

- locator operational state changes
- local-SID collision event

Following is a simplified graphical tree representation of the data model for SRv6 notifications:
module: ietf-srv6-base

notifications:

+---n srv6-locator-status-event
  |  +--ro operational-status?  srv6-types:srv6-status-type
+---n srv6-sid-collision-event
  +--ro sid?         srv6-types:srv6-sid
  +--ro existing
  |  +--ro end-behavior-type?  identityref
  +--ro requested
  |  +--ro end-behavior-type?  identityref

Figure 3: SRv6 Base - Notification Tree

3.4. SRv6 Static

SRv6-Static application allows a user to specify SRv6 local SIDs and program them in the forwarding plane. The SRv6-Static model is captured in the ietf-srv6-static module.

The associated YANG specification for this module is captured in Section 5.3.

3.4.1. Configuration

The SRv6-Static configuration augments the SRv6-base locator tree */rt:routing/srv6:srv6/locators/srv6:locator*

Following are salient features of the SRv6-Static config model:

- Allows static (explicit) configuration for local-SIDs under a given locator
- Given that entry is scoped under a locator, the key for each entry is function "opcode"
- A user must also specify end-behavior type (End* function) associated with the entry
- A user must also specify behavior-specific data with each entry. For example, for any end behavior requiring a table lookup, a lookup-table need be provided. Similarly, for any end behavior with forwarding next-hops need to specify next-hop information. The example of former include End, End.T, End.DT4, End.DT6, and
End.DT46, whereas example of later include End.X, End.DX4, End.DX6, End.B6, End.BM etc.

- Each local-SID entry has zero or more forwarding paths specified.

- A forwarding path has next-hop type that depends on the end behavior, and could be either ipv6, or ipv4, or mpls, or l2 type. For example, End.X, End.DX4, End.DX6, End.B6, End.BM, and End.DX2 will have ipv6, ipv4, ipv6, ipv6, mpls, and l2 next-hop types respectively.

- For each forwarding next-hop type, the appropriate path attributes are to be specified as well. For L2 type, the only other information required is the L2 interface name. Whereas for L3 (ipv6, ipv4, mpls) types, the information includes L3 interface name, next-hop IP address, weight, and protection information.

- Depending on the end behavior type, a forwarding path may have either MPLS or SRv6 encapsulation -- i.e., Stack of out-labels or Stack of SRv6 out-SIDs. The example of former is End.BM and example of later include the rest (End.X, End.DX4/DX6, End.B6 etc.).

Following is a simplified graphical tree representation of the data model for SRv6 Static configuration:

```plaintext
module: ietf-srv6-static

### 3.4.2. State

As per NMDA model, the state related to configuration items specified in above section Section 3.4.1 can be retrieved from the same tree. The state regarding the local-SIDs created by SRv6-static model can be obtained using the state model of SRv6-base. Hence, there is no additional state identified at this time for SRv6-static.

### 3.4.3. Notification

None.
4. Pending Items

Following are the items that will be addressed in next revisions:

- Align SRv6 base with SR (MPLS) model [I-D.ietf-spring-sr-yang].
- Extend local-SID collision event/notification in SRv6-base model.
- Add RPC support in the SRv6-base model.
- Add EVPN End functions in the SRv6-Static model.
- Add Service Chaining End functions in the SRv6-Static model.
- Add ARGS support in the SRv6-Static model.
- Add QoS support

5. YANG Specification

Following are actual YANG definition for SRv6 modules defined earlier in the document.

5.1. SRv6 Types

This YANG module imports types defined in [RFC6991].

Moreover, the module models behaviors defined in [I-D.ietf-spring-srv6-network-programming], [I-D.xuclad-spring-sr-service-chaining], and [I-D.ietf-dmm-srv6-mobile-uplane].

6. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer
is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The Network Configuration Access Control Model (NACM) [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes.

It goes without saying that this specification also inherits the security considerations captured in the SRv6 specification document [I-D.ietf-spring-srv6-network-programming].

7. IANA Considerations

This document requests the registration of the following URIs in the IETF "XML registry" [RFC3688]:

<table>
<thead>
<tr>
<th>URI</th>
<th>Registrant</th>
<th>XML</th>
</tr>
</thead>
<tbody>
<tr>
<td>urn:ietf:params:xml:ns:yang:ietf-srv6-types</td>
<td>The IESG</td>
<td>N/A</td>
</tr>
<tr>
<td>urn:ietf:params:xml:ns:yang:ietf-srv6-base</td>
<td>The IESG</td>
<td>N/A</td>
</tr>
<tr>
<td>urn:ietf:params:xml:ns:yang:ietf-srv6-static</td>
<td>The IESG</td>
<td>N/A</td>
</tr>
</tbody>
</table>

This document requests the registration of the following YANG modules in the "YANG Module Names" registry [RFC6020]:
## Acknowledgments

This draft is defining the similar YANG data model as [I-D.hu-spring-srv6-yang]. The authors of that draft have agreed to join this draft.

The authors would like to acknowledge Darren Dukes, Les Ginsberg, and Ahmed Bashandy for their input and review.
