A URN Namespace for ASD Specification 1000D
draft-rushing-s1000d-urn-00.txt

Status of this Memo

By submitting this Internet-Draft, each author represents that any applicable patent or other IPR claims of which he or she is aware have been or will be disclosed, and any of which he or she becomes aware will be disclosed, in accordance with Section 6 of BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/1id-abstracts.txt.

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html.

This Internet-Draft will expire on May 1, 2006.

Abstract

This document describes a Uniform Resource Name (URN) namespace for naming persistent resources defined by ASD Specification 1000D.

1. Introduction

Specification 1000D (S1000D) is an international specification for the procurement and production of technical publications. The current issue of the specification has been jointly produced by the Aerospace and Defence Industries Association of Europe (ASD, previously AECMA, European Association of Aerospace Industries) and the Aerospace Industries Association of America (AIA). The specification is used worldwide by a variety of commercial and government entities for the development of technical documentation.

The specification adopts ISO, CALS and W3C standards to promote document standardization in which information is generated in a neutral format. Compliant documentation generated using the specification can be processed on different, and often disparate, IT systems. It is this feature, added to the concept of modularization, which makes the specification acceptable to the wider international community.

Portions of S1000D define a resource coding system to allow resources created under the specification to be uniquely identified in global environment. To provide for the creation of a web-based resource management system, ASD would like to assign URNs to resources created under the specification in order to retain unique, permanent, location-independent names for these resources, in addition to providing a framework for resolution of these resources.

For more information about ASD and S1000D see http://www.s1000d.org.

This namespace specification is for a formal namespace.

2. Specification Template

Namespace ID:

To be assigned. Request the string "S1000D".

Registration information:

Version 2
Date: <2005-03-7, when submitted>

Declared registrant of the namespace:

Name: ASD TPSMG Chairperson
Address: Corporate Technical Services
Declaration of structure:

The identifier has the following ABNF structure.

; start ABNF notation
URN = "URN:" namespace NSS

namespace = "$1000D:

NSS = dmc-nss / pmc-nss / csn-nss / icn-nss
    com-nss / ddn-nss / dml-nss

;determine the subnamespace as an subnamespace identifier
; plus a subnamespace code string
; dmc-nss = "DMC-" nss-code
; pmc-nss = "PMC-" nss-code
; csn-nss = "CSN-" nss-code
; icn-nss = "ICN-" nss-code
; com-nss = "COM-" nss-code
; ddn-nss = "DDN-" nss-code
; dml-nss = "DML-" nss-code

;nss-code = subcode subext
;The code strings are a groups of alpha and digit characters
; separated by the dash character. The specific code syntax
; for each subnamespace is described in ASD Specification 1000D.

subcode = 1*(DIGIT / ALPHA / "-"

; define the encoding extension as an optional set of status
; indicators separated by the "_" character.

subext = [issue] [lang]
issue = "_I-" 3DIGIT
lang = "_L-" 2ALPHA
The following subnamespaces are currently defined:

- "DMC" - contains all Data Modules Codes
- "PMC" - contains all Publication Module Codes
- "CSN" - contains all Catalogue Sequence Numbers
- "ICN" - contains all Illustration Control Numbers.
- "COM" - contains all Comment Codes.
- "DDN" - contains all Data Dispatch Notices.
- "DML" - contains all Data Module Lists.

Example usage:

URN:S1000D:{subid}-{subcode}_{subext}

e.g., URN:S1000D:DMC-AE-A-07-05-0000-00A-040A-A_I-001_L-EN

where:

{subid} = DMC, The code is a Data Module Code
{subcode} = AE-A-07-05-0000-00A-040A-A, String in DMC syntax
{subext} = _I-001_L-EN, the first issue in English.

Relevant ancillary documentation:

ASD S1000D, Issue 2.2
Reference: Chap 7.4.1.2, "IETP - Resource resolution"
url: http://www.s1000d.org

Identifier uniqueness considerations:

Identifier uniqueness is guaranteed through processes outlined within ASD S1000D. All codes defined within the specification
must begin with a Model Identifier (MI) that will be registered
with the NATO Maintenance and Supply Agency (NAMSA) and is never
to be reused. All project generated codes are prefixed by the
assigned MI and are required by the specification to be unique
within the scope of the project. Since all project codes are
prefixed by a globally unique MI, and since these codes must be
unique within the project, all generated identifiers will
be globally unique.

Identifier persistence considerations:
Persistence of identifiers is dependent upon suitable delegation of resolution and the fact that generated identifiers are to be persistent once published. Existing information objects can be used in new projects by referencing them through their persistent identifiers.

Process of identifier assignment:

Identifiers are assigned in the following manner. Projects are assigned a Model Identifier by the NAMSA organization. Projects then generate identifiers using the processes outlined in ASD S1000D. The codes are prefixed with the encoding identifier and possibly postfixed by the extension status identifiers.

Process for identifier resolution:

The project identified by the Model Identifier is responsible for providing a method of resource resolution. A suggested method of resolution is outlined in ASD S1000D.

Rules for Lexical Equivalence:

All generated identifiers are to be considered are case-insensitive.

Conformance with URN syntax:

No special considerations.

Validation mechanism:

Identifiers must conform to ASD S1000D.

Scope:

Global.

3. Examples

The following examples are not guaranteed to be real and are provided for illustrative purposes only.

URN:S1000D:DMC-AE-A-07-04-0101-00A-040A-A
URN:S1000D:DMC-AE-A-07-05-0000-00A-040A-A_I-001L-EN
URN:S1000D:ICN-AE-B-291101-M-C0419-00571-A-01-1
URN:S1000D:PMC-AE-F6117-00001-00
4. Security Considerations

There are no additional security considerations other than those normally associated with the use and resolution of URNs in general.

5. Namespace Considerations and Community Considerations

Resources will be named and maintained in accordance with the processes described in this document, in addition to the processes described in S1000D. Any organization or individual can utilize the specification to create resources described by S1000D. Resolution and/or use of created resources is unrestricted by the specification in order to promote widespread adoption of open ASD standards, although organizations creating resources may control them as they see fit.

6. IANA Considerations

This document describes a "S1000D" URN NID registration for the S1000D organization and will need to be entered into the IANA registry of URN NIDs upon approval. (http://www.iana.org/assignments/urn-namespaces).
