Abstract

The QUIC DATAGRAM extension provides application protocols running over QUIC with a mechanism to send unreliable data while leveraging the security and congestion-control properties of QUIC. However, QUIC DATAGRAM frames do not provide a means to demultiplex application contexts. This document defines how to use QUIC DATAGRAM frames when the application protocol running over QUIC is HTTP/3 by adding an identifier at the start of the frame payload.

Discussion of this work is encouraged to happen on the QUIC IETF mailing list quic@ietf.org [1] or on the GitHub repository which contains the draft: https://github.com/DavidSchinazi/draft-h3-datagram [2].

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on May 7, 2020.

1.  Introduction

The QUIC DATAGRAM extension [I-D.pauly-quic-datagram] provides application protocols running over QUIC [I-D.ietf-quic-transport] with a mechanism to send unreliable data while leveraging the security and congestion-control properties of QUIC. However, QUIC DATAGRAM frames do not provide a means to demultiplex application contexts. This document defines how to use QUIC DATAGRAM frames when the application protocol running over QUIC is HTTP/3 [I-D.ietf-quic-http] by adding an identifier at the start of the frame payload.

This design mimics the use of Stream Types in HTTP/3, which provide a demultiplexing identifier at the start of each unidirectional stream.

Discussion of this work is encouraged to happen on the QUIC IETF mailing list quic@ietf.org [3] or on the GitHub repository which contains the draft: https://github.com/DavidSchinazi/draft-h3-datagram [4].

1.1.  Conventions and Definitions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP
2. HTTP/3 DATAGRAM Frame Format

When used with HTTP/3, the Datagram Data field of QUIC DATAGRAM frames uses the following format:

```
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|                     Flow Identifier (i)                     ...
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|                 HTTP/3 Datagram Payload (*)                 ...
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

Figure 1: HTTP/3 DATAGRAM Frame Format

Flow Identifier: A variable-length integer indicating the Flow Identifier of the datagram (see Section 2.1).

HTTP/3 Datagram Payload: The payload of the datagram, whose semantics are defined by individual applications.

2.1. Flow Identifiers

Flow identifiers represent bidirectional flows of datagrams within a single QUIC connection. These are conceptually similar to UDP ports and allow basic demultiplexing of application data. The primary role of flow identifiers is to provide a standard mechanism for demultiplexing application data flows, which may be destined for different processing threads in the application, akin to UDP sockets.

Beyond this, a sender SHOULD ensure that DATAGRAM frames within a single flow are transmitted in order relative to one another. If multiple DATAGRAM frames can be packed into a single QUIC packet, the sender SHOULD group them by flow identifier to promote fate-sharing within a specific flow and improve the ability to process batches of datagram messages efficiently on the receiver.

3. Flow Identifier Allocation

Implementations of HTTP/3 that support the DATAGRAM extension will provide a flow identifier allocation service. That service will allow applications co-located with HTTP/3 to request a unique flow identifier that they can subsequently use for their own purposes. The HTTP/3 implementation will then parse the flow identifier of
incoming DATAGRAM frames and use it to deliver the frame to the appropriate application.

The flow identifier allocation services on both endpoints in a connection will need to coordinate to agree on the meaning of each flow identifier. This will require signalling, which is currently work in progress. This signalling mechanism will also need a way to flow control the amount of flow identifiers generated by a given endpoint.

4. Security Considerations

This document currently does not have additional security considerations beyond those defined in [I-D.ietf-quic-transport] and [I-D.pauly-quic-datagram].

5. IANA Considerations

This document has no IANA actions.
