Routing Policy Configuration Model for Service Provider Networks
draft-shaikh-rtgwg-policy-model-01

Abstract

This document defines a YANG data model for configuring and managing routing policies in a vendor-neutral way and based on actual operational practice. The model provides a generic policy framework which can be augmented with protocol-specific policy configuration.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 5, 2016.

1. Introduction

This document describes a YANG [RFC6020] data model for routing policy configuration based on operational usage and best practices in a variety of service provider networks. The model is intended to be vendor-neutral, in order to allow operators to manage policy configuration in a consistent, intuitive way in heterogeneous environments with routers supplied by multiple vendors.

1.1. Goals and approach

This model does not aim to be feature complete -- it is a subset of the policy configuration parameters available in a variety of vendor implementations, but supports widely used constructs for managing how routes are imported, exported, and modified across different routing protocols. The model development approach has been to examine actual policy configurations in use across a number of operator networks. Hence the focus is on enabling policy configuration capabilities and structure that are in wide use.

Despite the differences in details of policy expressions and conventions in various vendor implementations, the model reflects the observation that a relatively simple condition-action approach can be readily mapped to several existing vendor implementations, and also gives operators an intuitive and straightforward way to express policy without sacrificing flexibility. A side affect of this design decision is that legacy methods for expressing policies are not considered. Such methods could be added as an augmentation to the model if needed.

Consistent with the goal to produce a data model that is vendor neutral, only policy expressions that are deemed to be widely available in existing major implementations are included in the model. Those configuration items that are only available from a single implementation are omitted from the model with the expectation they will be available in separate vendor-provided modules that augment the current model.

2. Model overview

The routing policy model is defined in two YANG modules, the main policy module, and an auxiliary module providing additional generic types. The model has three main parts:
A generic framework to express policies as sets of related conditions and actions. This includes match sets and actions that are useful across many routing protocols.

A structure that allows routing protocol models to add protocol-specific policy conditions and actions though YANG augmentations. There is a complete example of this for BGP [RFC4271] policies in the proposed vendor-neutral BGP data model [I-D.shaikh-idr-bgp-model].

A reusable grouping for attaching import and export rules in the context of routing configuration for different protocols, VRFs, etc. This also enables creation of policy chains and expressing default policy behavior.

These modules make use of the standard Internet types, such as IP addresses, autonomous system numbers, etc., defined in RFC 6991 [RFC6991].

3. Route policy expression

Policies are expressed as a sequence of top-level policy definitions each of which consists of a sequence of policy statements. Policy statements in turn consist of simple condition-action tuples. Conditions may include multiple match or comparison operations, and similarly, actions may effect multiple changes to route attributes, or indicate a final disposition of accepting or rejecting the route. This structure is shown below.

```
+---rw routing-policy
   +---rw policy-definitions
      +---rw policy-definition* [name]
         +---rw name          string
         +---rw statements
            +---rw statement* [name]
               +---rw name          string
               +---rw conditions
               |                     ...
               +---rw actions
                  ...
```

3.1. Defined sets for policy matching

The models provides a set of generic sets that can be used for matching in policy conditions. These sets are applicable across multiple routing protocols, and may be further augmented by protocol-specific models which have their own defined sets. The supported defined sets include:
prefix sets – define a set of IP prefixes, each with an associated CIDR netmask range (or exact length)

neighbor sets – define a set of neighboring nodes by their IP addresses

tag set – define a set of generic tag values that can be used in matches for filtering routes

The model structure for defined sets is shown below.

```plaintext
+--rw routing-policy
   +--rw defined-sets
      +--rw prefix-sets
         |  +--rw prefix-set* [prefix-set-name]
         |     +--rw prefix-set-name    string
         |     +--rw prefix* [ip-prefix masklength-range]
         |        +--rw ip-prefix           inet:ip-prefix
         |        +--rw masklength-range    string
         +--rw neighbor-sets
         |  +--rw neighbor-set* [neighbor-set-name]
         |     +--rw neighbor-set-name    string
         |     +--rw neighbor* [address]
         |        +--rw address    inet:ip-address
         +--rw tag-sets
         |  +--rw tag-set* [tag-set-name]
         |     +--rw tag-set-name    string
         |     +--rw tag* [value]
         |        +--rw value    pt:tag-type
```

3.2. Policy conditions

Policy statements consist of a set of conditions and actions (either of which may be empty). Conditions are used to match route attributes against a defined set (e.g., a prefix set), or to compare attributes against a specific value.

Match conditions may be further modified using the match-set-options configuration which allows operators to change the behavior of a match. Three options are supported:

- **ALL** – match is true only if the given value matches all members of the set.

- **ANY** – match is true if the given value matches any member of the set.
- INVERT - match is true if the given value does not match any member of the given set.

Not all options are appropriate for matching against all defined sets (e.g., match ALL in a prefix set does not make sense). In the model, a restricted set of match options is used where applicable.

Comparison conditions may similarly use options to change how route attributes should be tested, e.g., for equality or inequality, against a given value.

While most policy conditions will be added by individual routing protocol models via augmentation, this routing policy model includes several generic match conditions and also the ability to test which protocol or mechanism installed a route (e.g., BGP, IGP, static, etc.). The conditions included in the model are shown below.

```bash
+--rw routing-policy
    +--rw policy-definitions
    |  +--rw policy-definition* [name]
    |  +--rw statements
    |  |  +--rw statement* [name]
    |  |  +--rw conditions
    |  |     +--rw call-policy?
    |  |     +--rw match-prefix-set!
    |  |     |  +--rw prefix-set?
    |  |     |  +--rw match-set-options?
    |  |     +--rw match-neighbor-set!
    |  |     |  +--rw neighbor-set?
    |  |     |  +--rw match-set-options?
    |  |     +--rw match-tag-set!
    |  |     |  +--rw tag-set?
    |  |     +--rw match-set-options?
    |  +--rw install-protocol-eq?
    +--rw igp-conditions
```

### 3.3. Policy actions

When policy conditions are satisfied, policy actions are used to set various attributes of the route being processed, or to indicate the final disposition of the route, i.e., accept or reject.

Similar to policy conditions, the routing policy model includes generic actions in addition to the basic route disposition actions. These are shown below.
3.4. Policy subroutines

Policy ‘subroutines’ (or nested policies) are supported by allowing policy statement conditions to reference other policy definitions using the call-policy configuration. Called policies apply their conditions and actions before returning to the calling policy statement and resuming evaluation. The outcome of the called policy affects the evaluation of the calling policy. If the called policy results in an accept-route (either explicit or by default), then the subroutine returns an effective boolean true value to the calling policy. For the calling policy, this is equivalent to a condition statement evaluating to a true value and evaluation of the policy continues (see Section 4). Note that the called policy may also modify attributes of the route in its action statements. Similarly, a reject-route action returns false and the calling policy evaluation will be affected accordingly.

Note that the called policy may itself call other policies (subject to implementation limitations). The model does not prescribe a nesting depth because this varies among implementations, with some major implementations only supporting a single subroutine, for example. As with any routing policy construction, care must be taken with nested policies to ensure that the effective return value results in the intended behavior. Nested policies are a convenience in many routing policy constructions but creating policies nested beyond a small number of levels (e.g., 2-3) should be discouraged.

4. Policy evaluation

Evaluation of each policy definition proceeds by evaluating its corresponding individual policy statements in order. When a condition statement in a policy statement is satisfied, the corresponding action statement is executed. If the action statement has either accept-route or reject-route actions, evaluation of the
current policy definition stops, and no further policy definitions in
the chain are evaluated.

If the condition is not satisfied, then evaluation proceeds to the
next policy statement. If none of the policy statement conditions
are satisfied, then evaluation of the current policy definition
stops, and the next policy definition in the chain is evaluated.
When the end of the policy chain is reached, the default route
disposition action is performed (i.e., reject-route unless an an
alternate default action is specified for the chain).

5. Applying routing policy

Routing policy is applied by defining and attaching policy chains in
various routing contexts. Policy chains are sequences of policy
definitions (described in Section 3) that have an associated
direction (import or export) with respect to the routing context in
which they are defined. The routing policy model defines an apply-
policy grouping that can be imported and used by other models. As
shown below, it allows definition of import and export policy chains,
as well as specifying the default route disposition to be used when
no policy definition in the chain results in a final decision.

+--rw apply-policy
    |   +--rw config
    |       +--rw import-policy*
    |       +--rw default-import-policy? default-policy-type
    |       +--rw export-policy*
    |       +--rw default-export-policy? default-policy-type

The default policy defined by the model is to reject the route for
both import and export policies.

An example of using the apply-policy group in another routing model
is shown below for BGP. Here, import and export policies are applied
in the context of a particular BGP peer group. Note that the policy
chains reference policy definitions by name that are defined in the
routing policy model.
6. Routing protocol-specific policies

Routing models that require the ability to apply routing policy may augment the routing policy model with protocol or other specific policy configuration. The routing policy model assumes that additional defined sets, conditions, and actions may all be added by other models.
An example of this is shown below, in which the BGP configuration model in [I-D.shaikh-idr-bgp-model] adds new defined sets to match on community values or AS paths. The model similarly augments BGP-specific conditions and actions into the corresponding sections of the routing policy model.

```Yang
++-rw routing-policy
   +-rw defined-sets
      +-rw prefix-sets
         |  +--rw prefix-set* [prefix-set-name]
         |      |  +--rw prefix-set-name
         |      |  +--rw prefix* [ip-prefix masklength-range]
         |      |     |  +--rw ip-prefix
         |      |     |  +--rw masklength-range
         |  +--rw neighbor-sets
         |     |  +--rw neighbor-set* [neighbor-set-name]
         |     |      |  +--rw neighbor-set-name
         |     |      |  +--rw neighbor* [address]
         |     |      |     |  +--rw address
         |  +--rw tag-sets
         |     |  +--rw tag-set* [tag-set-name]
         |     |      |  +--rw tag-set-name
         |     |      |  +--rw tag* [value]
         |     |      |     |  +--rw value
      +-rw bgp-pol:bgp-defined-sets
         |  +-rw bgp-pol:community-sets
         |     |  +--rw bgp-pol:community-set* [community-set-name]
         |     |      |  +--rw bgp-pol:community-set-name
         |     |      |  +--rw bgp-pol:community-member*
         |  +-rw bgp-pol:ext-community-sets
         |     |  +--rw bgp-pol:ext-community-set* [ext-community-set-name]
         |     |      |  +--rw bgp-pol:ext-community-set-name
         |     |      |  +--rw bgp-pol:ext-community-member*
         |  +-rw bgp-pol:as-path-sets
         |     |  +--rw bgp-pol:as-path-set* [as-path-set-name]
         |     |      |  +--rw bgp-pol:as-path-set-name
         |     |      |  +--rw bgp-pol:as-path-set-member*
```

7. Security Considerations

Routing policy configuration has a significant impact on network operations, and as such any related model carries potential security risks.

YANG data models are generally designed to be used with the NETCONF protocol over an SSH transport. This provides an authenticated and secure channel over which to transfer configuration and operational data. Note that use of alternate transport or data encoding (e.g.,
JSON over HTTPS) would require similar mechanisms for authenticating and securing access to configuration data.

Most of the data elements in the policy model could be considered sensitive from a security standpoint. Unauthorized access or invalid data could cause major disruption.

8. IANA Considerations

This YANG data model and the component modules currently use a temporary ad-hoc namespace. If and when it is placed on redirected for the standards track, an appropriate namespace URI will be registered in the IETF XML Registry [RFC3688]. The routing policy YANG modules will be registered in the "YANG Module Names" registry [RFC6020].

9. YANG modules

The routing policy model is described by the YANG modules in the sections below.

9.1. Routing policy model

```Yang
<CODE BEGINS> file routing-policy.yang
module routing-policy {

    yang-version "1";

    // namespace
    namespace "http://openconfig.net/yang/routing-policy";

    prefix "rpol";

    // import some basic types
    import ietf-inet-types { prefix inet; }
    import policy-types {prefix pt; }

    // meta
    organization
        "OpenConfig working group";

    contact
        "OpenConfig working group
    netopenconfig@googlegroups.com";

    description
        "This module describes a YANG model for routing policy
```
configuration. It is a limited subset of all of the policy configuration parameters available in the variety of vendor implementations, but supports widely used constructs for managing how routes are imported, exported, and modified across different routing protocols. This module is intended to be used in conjunction with routing protocol configuration models (e.g., BGP) defined in other modules.

Route policy expression:

Policies are expressed as a set of top-level policy definitions, each of which consists of a sequence of policy statements. Policy statements consist of simple condition-action tuples. Conditions may include multiple match or comparison operations, and similarly actions may be multitude of changes to route attributes or a final disposition of accepting or rejecting the route.

Route policy evaluation:

Policy definitions are referenced in routing protocol configurations using import and export configuration statements. The arguments are members of an ordered list of named policy definitions which comprise a policy chain, and optionally, an explicit default policy action (i.e., reject or accept).

Evaluation of each policy definition proceeds by evaluating its corresponding individual policy statements in order. When a condition statement in a policy statement is satisfied, the corresponding action statement is executed. If the action statement has either accept-route or reject-route actions, policy evaluation of the current policy definition stops, and no further policy definitions in the chain are evaluated. If the condition is not satisfied, then evaluation proceeds to the next policy statement. If none of the policy statement conditions are satisfied, then evaluation of the current policy definition stops, and the next policy definition in the chain is evaluated. When the end of the policy chain is reached, the default route disposition action is performed (i.e., reject-route unless an alternate default action is specified for the chain).

Policy ‘subroutines’ (or nested policies) are supported by allowing policy statement conditions to reference another policy definition which applies conditions and actions from the referenced policy before returning to the calling policy statement and resuming evaluation. If the called policy results in an accept-route (either explicit or by default), then
the subroutine returns an effective true value to the calling policy. Similarly, a reject-route action returns false. If the subroutine returns true, the calling policy continues to evaluate the remaining conditions (using a modified route if the subroutine performed any changes to the route).

10. Policy examples

Below we show an example of XML-encoded configuration data using the routing policy and BGP models to illustrate both how policies are defined, and also how they can be applied. Note that the XML has been simplified for readability.

```xml
<routing-policy>
  <defined-sets>
    <prefix-sets>
      <prefix-set>
        <prefix-set-name>prefix-set-A</prefix-set-name>
        <prefix>
          <ip-prefix>192.0.2.0/24</ip-prefix>
          <masklength-range>24..32</masklength-range>
        </prefix>
      </prefix-set>
      <prefix-set>
        <prefix-set-name>prefix-set-B</prefix-set-name>
        <prefix>
          <ip-prefix>10.0.0.0/16</ip-prefix>
        </prefix>
      </prefix-set>
    </prefix-sets>
  </defined-sets>
</routing-policy>
```
<masklength-range>16..32</masklength-range>
</prefix>
<prefix>
<ip-prefix>192.168.0.0/19</ip-prefix>
</prefix>
<masklength-range>19..24</masklength-range>
</prefix>
</prefix-set>
</prefix-sets>
tag-sets>
tag-set>
tag-set-name>cust-tag1</tag-set-name>
tag>
$value>10</value>
tag>
tag-set>
tag-sets>
</defined-sets>
<policy-definitions>
policy-definition>
<name>export-tagged-BGP</name>
<statements>
<statement>
$name>term-0</name>
<conditions>

11.1. Normative references

11.2. Informative references

Appendix A. Acknowledgements

The authors are grateful for valuable contributions to this document and the associated models from: Ebben Aires, Luyuan Fang, Josh George, Acee Lindem, Stephane Litkowski, Ina Minei, Carl Moberg, Eric Osborne, Steve Padgett, Juergen Schoenwaelder, Jim Uttaro, and Russ White.

Appendix B. Change summary

B.1. Changes between revisions -00 and -01

The -01 revision of the policy model reflects a number of changes to the data model based on additional operator, reviewer, and implementor feedback.

- Modified the apply-policy container to use the pattern for modeling operational state described in [I-D.openconfig-netmod-opstate].
- Updated prefix lists to use ip-prefix type and masklength range to better enable range-checking and validation. Added an ‘exact’ option to the masklength range.
- Changed accept / reject route to be within a choice statement.
- Added enclosing containers to lists.
- Minor changes to leaf-lists in defined sets definitions; also to apply-policy container structure.
- Added second type of match-options set to handle restricted case of only ANY | INVERT (i.e., without ALL). The restricted enumerated type is now associated with the appropriate types of sets.
- Moved install-protocol-type identity to policy-types module.
- Removed require-instance statements from leafrefs pending availability in YANG 1.1.
- Fixed discrepancies in the example shown in the document, and simplified the example.
