Factory default Setting
draft-wu-netmod-factory-default-03

Abstract

This document defines a method to reset a YANG server to its factory-default content. The reset operation may be used e.g. during initial zero-touch configuration or when the existing configuration has major errors, so re-starting the configuration process from scratch is the best option.

A new factory-reset RPC is defined. Several methods of documenting the factory-default content are specified.

Optionally a new "factory-default" read-only datastore is defined, that contains the data that will be copied over to the running datastore at reset.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on November 7, 2019.
1. Introduction

This document defines a method to reset a YANG server to its factory-default content. The reset operation may be used e.g. during initial zero-touch configuration or when the existing configuration has major errors, so re-starting the configuration process from scratch is the best option. When resetting a datastore all previous configuration settings will be lost and replaced by the factory-default content.

A new factory-reset RPC is defined. Several methods of documenting the factory-default content are specified.
Optionally a new "factory-default" read-only datastore is defined, that contains the data that will be copied over to the <startup>,<candidate>,<running> datastore at reset. This datastore can also be used in <get-data> or <copy-config> operations.

NETCONF defines the <delete> operation that allows resetting the <startup> datastore and the <discard-changes> operation that copies the content of the <running> datastore into the <candidate> datastore. However it is not possible to reset the running datastore, to reset the candidate datastore without changing the running datastore or to reset any dynamic datastore.

A RESTCONF server MAY implement the above NETCONF operations, but that would still not allow it to reset the running configuration.

1.1. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

The following terms are defined in [RFC8342] and are not redefined here:

- startup configuration datastore
- candidate configuration datastore
- running configuration datastore
- intended configuration datastore
- operational state datastore

The following terms are defined in this document as follows:

- factory-default datastore: A read-only datastore holding a preconfigured minimal initial configuration that can be used to initialize the configuration of a server. The content of the datastore is usually static, but MAY depend on external factors like available HW.
2. Factory-Reset RPC

A new "factory-reset" RPC is introduced. Upon receiving the RPC the YANG server resets the content of <running>, <candidate> and <startup> to its factory-default content. Read-only datastores receive their content from other datastores (e.g. <intended> gets its content from <running>).

Factory-default content SHALL be specified by one of the following means in order of precedence:

1. For the <running>, <candidate> and <startup> datastores as the content of the <factory-default> datastore, if it exists
2. YANG Instance Data [I-D.ietf-netmod-yang-instance-file-format]
3. In some implementation specific manner
4. For dynamic datastores unless otherwise specified the factory-default content is empty.

3. Factory-Default Datastore

This document introduces a new datastore resource named 'Factory-Default' that represents a preconfigured minimal initial configuration that can be used to initialize the configuration of a server.

- Name: "factory-default"
- YANG modules: all
- YANG nodes: all "config true" data nodes

Management operations: The content of the datastore is set by the YANG server in an implementation dependent manner. The content can not be changed by management operations via NETCONF, RESTCONF, the CLI etc. unless specialized, dedicated operations are provided. The contents of the datastore can be read using NETCONF, RESTCONF <get-data> operation. The operation <factory-reset> can be used to copy the content of the datastore to a set of another datastores. For <copy-config> operation, it can be used to copy the content of the datastore to another datastore, however the content of the datastore is not propagated automatically to any other datastores.

- Origin: This document does not define a new origin identity as it does not interact with <operational> datastore.
o Protocols: RESTCONF, NETCONF and other management protocol.

o Defining YANG module: "ietf-factory-default"

The datastore content is usually defined by the device vendor. It is usually static, but MAY change e.g. depending on external factors like HW available or during device upgrade.

On devices that support non-volatile storage, the contents of <factory > MUST persist across restarts

4. YANG Module

<CODE BEGINS> file "ietf-factory-default.yang"
module ietf-factory-default {
   yang-version 1.1;
   prefix fdef;

   import ietf-netconf { prefix nc ; }
   import ietf-datastores { prefix ds; }

   organization
      "IETF NETMOD (Network Modeling) Working Group";
   contact
      "WG Web:   <https://tools.ietf.org/wg/netconf/>
      WG List:  <mailto:netconf@ietf.org>
      WG Chair: Lou Berger
      <mailto:lberger@labn.net>
      WG Chair: Joel Jaeggli
      <mailto:joelja@bogus.com>
      WG Chair: Kent Watsen
      <mailto:kwatsen@juniper.net>
      Editor:   Balazs Lengyel
      <mailto:balazs.lengyel@ericsson.com>
      Editor:   Qin Wu
      <mailto:bill.wu@huawei.com>
      Editor:   Ye Niu
      <mailto:niuye@huawei.com>";
   description
      "This module defines the
       - factory-reset RPC
       - factory-default datastore
       - an extension to the NETCONF <copy-config> operation to allow it to operate on the factory-default datastore."
It provides functionality to reset a YANG server to its factory-default content.

    }
}

5. IANA Considerations

This document registers one URI in the IETF XML Registry [RFC3688]. The following registration has been made:

Registrant Contact: The IESG.

XML: N/A, the requested URI is an XML namespace.

This document registers one YANG module in the YANG Module Names Registry [RFC6020]. The following registration has been made:

name: ietf-factory-default

prefix: fdef

RFC: xxxx

6. Security Considerations

The <factory-reset> RPC can overwrite important and security sensitive information in one of the other datastores e.g. running, therefore it is important to restrict access to this RPC using the standard access control methods. [RFC8341]

The content of the factory-default datastore is usually not security sensitive as it is the same on any device of a certain type.
7. Acknowledgements

Thanks to Juergen Schoenwaelder, Ladislav Lhotka, Alex Campbell, Joe Clark, Robert Wilton, Kent Watsen, Joel Jaeggli, Andy Berman, Susan Hares to review this draft and provide important input to this document.

9. References

9.1. Normative References

9.2. Informative References

Appendix A. Open Issues

- Do we need an extra parameter that may order a restart of the YANG-server or the whole system?
- Do we allow different datastore have different factory default content? No

Appendix B. Difference between <startup> datastore and <factory-default> datastore

When the device first boots up, the content of the <startup> and <factory-default> will be identical. The content of <startup> can be subsequently changed by using <startup> as a target in a <copy-config> operation. The <factory-default> is a read-only datastore and it is usually static as described in earlier sections.

Appendix C. Changes between revisions

v02 - v03

- Change reset-datastore RPC into factory-reset RPC to allow reset the whole device with factory default content.
- Remove target datastore parameter from factory-reset RPC.
- Other editorial changes.

v01 - v02

- Add copy-config based on Rob’s comment.
- Reference Update.

v3 - v00 - v01

- Changed name from draft-wu-netconf-restconf-factory-restore to draft-wu-netmod-factory-default
- Removed copy-config; reset-datastore is enough

v02 - v03
o Restructured

o Made new datastore optional

o Removed Netconf capability

o Listed Open issues

v01 - v02

o -

v00 - v01

o -
