Echo Request/Reply for In-situ OAM Capabilities
draft-xiao-ippm-ioam-conf-state-03

Abstract

This document describes an extension to the echo request/reply mechanisms used in MPLS LSP, SRv6, and SFC environments, which can be used within an IOAM domain, allowing the IOAM encapsulating node to acquire IOAM capabilities of each IOAM transit node and/or IOAM decapsulating node.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 9, 2019.

1. Introduction

The Data Fields for In-situ OAM (IOAM) [I-D.ietf-ippm-ioam-data] defines data fields for IOAM which records OAM information within the packet while the packet traverses a particular network domain, which is called an IOAM domain. IOAM can be used to complement OAM mechanisms based on, e.g., ICMP or other types of probe packets, and IOAM mechanisms can be leveraged where mechanisms using, e.g., ICMP do not apply or do not offer the desired results.

As specified in [I-D.ietf-ippm-ioam-data], within the IOAM-domain, the IOAM data may be updated by network nodes that the packet traverses. The device which adds an IOAM data container to the packet to capture IOAM data is called the "IOAM encapsulating node", whereas the device which removes the IOAM data container is referred to as the "IOAM decapsulating node". Nodes within the domain which are aware of IOAM data and read and/or write or process the IOAM data are called "IOAM transit nodes". Both the IOAM encapsulating node and the decapsulating node are referred to as domain edge devices, which can be hosts or network devices.

In order to add accurate IOAM data container to the packet, the IOAM encapsulating node needs to know IOAM capabilities at the IOAM transit nodes and/or the IOAM decapsulating node as a whole, e.g.,
how many IOAM transit nodes will add tracing data and what kinds of data fields will be added.

This document describes an extension to the echo request/reply mechanisms used in MPLS LSP, SRv6, and SFC environments, which can be used within an IOAM domain, allowing the IOAM encapsulating node to acquire IOAM capabilities of each IOAM transit node and/or IOAM decapsulating node.

The following documents contain references to the echo request/reply mechanisms used in MPLS LSP, SRv6, and SFC environments:

- [RFC8029] ("Detecting Multiprotocol Label Switched (MPLS) Data-Plane Failures")
- [I-D.ali-spring-srv6-oam] ("Operations, Administration, and Maintenance (OAM) in Segment Routing Networks with IPv6 Data plane (SRv6")
- [I-D.ietf-sfc-multi-layer-oam] ("Active OAM for Service Function Chains in Networks")

The feature described in this document is assumedly applied to explicit path (strict or loose), because the precondition for this feature to work is that the echo request reaches each IOAM transit node as live traffic traverses.

1.1. Conventions Used in This Document

1.1.1. Terminology

E2E: Edge to Edge

ICMP: Internet Control Message Protocol

IOAM: In-situ Operations, Administration, and Maintenance

LSP: Label Switched Path

MPLS: Multi-Protocol Label Switching

MBZ: Must Be Zero

MTU: Maximum Transmission Unit

NTP: Network Time Protocol

OAM: Operations, Administration, and Maintenance
1.1.2. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

2. IOAM Capabilities Formats

2.1. IOAM Capabilities TLV in Echo Request

In echo request IOAM Capabilities uses TLV (Type-Length-Value tuple) which have the following format:

```
+---------------------------------------------|
| Type = IOAM Capabilities | Length |
+---------------------------------------------|
| Namespace-IDs Length | MBZ |
+---------------------------------------------|
| . List of Namespace-IDs . |
+---------------------------------------------|
```

Figure 1: IOAM Capabilities TLV in Echo Request

When this TLV is present in the echo request sent by an IOAM encapsulating node, it means that the IOAM encapsulating node requests the receiving node to reply with its IOAM capabilities. If there is no IOAM capability to be reported by the receiving node, then this TLV SHOULD be ignored by the receiving node, which means
the receiving node SHOULD send echo reply without IOAM capabilities or no echo reply, in the light of whether the echo request includes other TLV than IOAM Capabilities TLV. List of Namespace-IDs MAY be included in this TLV of echo request, it means that the IOAM encapsulating node requests only the IOAM capabilities which matches one of the Namespace-IDs. The Namespace-ID has the same definition as what’s specified in [I-D.ietf-ippm-ioam-data].

Type is set to the value which indicates that it’s an IOAM Capabilities TLV.

Length is the length of the TLV’s Value field in octets, Namespace-IDs Length is the Length of the List of Namespace-IDs field in octets.

Value field of this TLV is zero padded to align to a 4-octet boundary.

2.2. IOAM Capabilities TLV in Echo Reply

In echo reply IOAM Capabilities uses TLV which have the following format:

```
0                   1                   2                   3
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|    Type = IOAM Capabilities   |            Length             |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|        Sub-TLVs Length        |              MBZ              |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+

List of Sub-TLVs

+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+

Figure 2: IOAM Capabilities TLV in Echo Reply
```

When this TLV is present in the echo reply sent by an IOAM transit node and/or an IOAM decapsulating node, it means that IOAM function is enabled at this node and this TLV contains IOAM capabilities of the sender. List of Sub-TLVs which contain the IOAM capabilities SHOULD be included in this TLV of the echo reply. Note that the IOAM encapsulating node or the IOAM decapsulating node can also be an IOAM transit node.
Type is set to the value which indicates that it’s an IOAM Capabilities TLV.

Length is the length of the TLV’s Value field in octets, Sub-TLVs Length is the length of the List of Sub-TLVs field in octets.

Value field of this TLV or any Sub-TLV is zero padded to align to a 4-octet boundary. Based on the data fields for IOAM specified in [I-D.ietf-ippm-ioam-data], five kinds of Sub-TLVs are defined in this document, and in an IOAM Capabilities TLV the same kind of Sub-TLV can appear more times than one with different Namespace-ID. Note that the IOAM encapsulating node may receive both IOAM Pre-allocated Tracing Capabilities sub-TLV and IOAM Incremental Tracing Capabilities sub-TLV in the process of traceroute, which means both pre-allocated tracing node and incremental tracing node are on the same path, or some node supports both pre-allocated tracing and incremental tracing, the behavior of the IOAM encapsulating node in this scenario is outside the scope of this document.

2.2.1. IOAM Pre-allocated Tracing Capabilities sub-TLV

```
0                   1                   2                   3
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|Sub-type = Pre-allocated trace |            Length             |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|               IOAM-Trace-Type                 |    Reserved   |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|         Namespace-ID          |          Egress_MTU           |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|  Egress_if_id (short or wide format)         ......           |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

Figure 3: IOAM Pre-allocated Tracing Capabilities Sub-TLV

When this sub-TLV is present in the IOAM Capabilities TLV, it means that the sending node is an IOAM transit node and IOAM tracing function is enabled at this IOAM transit node.

Sub-type is set to the value which indicates that it’s an IOAM Pre-allocated Tracing Capabilities sub-TLV.

Length is the length of the sub-TLV’s Value field in octets, if Egress_if_id is in the short format which is 16 bits long, it MUST be set to 10, and if Egress_if_id is in the wide format which is 32 bits long, it MUST be set to 12.
IOAM-Trace-Type field has the same definition as what’s specified in section 4.2 of [I-D.ietf-ippm-ioam-data].

Reserved field is reserved for future use and MUST be set to zero.

Namespace-ID field has the same definition as what’s specified in section 4.2 of [I-D.ietf-ippm-ioam-data], it should be a one of the Namespace-IDs listed in the IOAM Capabilities TLV of echo request.

Egress_MTU field has 16 bits and specifies the MTU of the egress direction out of which the sending node would forward the received echo request, it should be the MTU of the egress interface or the MTU between the sending node and the downstream IOAM transit node.

Egress_if_id field has 16 bits (in short format) or 32 bits (in wide format) and specifies the identifier of the egress interface out of which the sending node would forward the received echo request.

### 2.2.2. IOAM Incremental Tracing Capabilities sub-TLV

<table>
<thead>
<tr>
<th>Sub-type = Incremental trace</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOAM-Trace-Type</td>
<td>Reserved</td>
</tr>
<tr>
<td>Namespace-ID</td>
<td>Egress_MTU</td>
</tr>
<tr>
<td>Egress_if_id (short or wide format)</td>
<td></td>
</tr>
</tbody>
</table>

![Figure 4: IOAM Incremental Tracing Capabilities Sub-TLV](image)

When this sub-TLV is present in the IOAM Capabilities TLV, it means that the sending node is an IOAM transit node and IOAM tracing function is enabled at this IOAM transit node.

Sub-type is set to the value which indicates that it’s an IOAM Incremental Tracing Capabilities sub-TLV.

Length is the length of the sub-TLV’s Value field in octets, if Egress_if_id is in the short format which is 16 bits long, it MUST be set to 10, and if Egress_if_id is in the wide format which is 32 bits long, it MUST be set to 12.
IOAM-Trace-Type field has the same definition as what’s specified in section 4.2 of [I-D.ietf-ippm-ioam-data].

Reserved field is reserved for future use and MUST be set to zero.

Namespace-ID field has the same definition as what’s specified in section 4.2 of [I-D.ietf-ippm-ioam-data], it should be a one of the Namespace-IDs listed in the IOAM Capabilities TLV of echo request.

Egress_MTU field has 16 bits and specifies the MTU of the egress direction out of which the sending node would forward the received echo request, it should be the MTU of the egress interface or the MTU between the sending node and the downstream IOAM transit node.

Egress_if_id field has 16 bits (in short format) or 32 bits (in wide format) and specifies the identifier of the egress interface out of which the sending node would forward the received echo request.

2.2.3. IOAM Proof of Transit Capabilities sub-TLV

When this sub-TLV is present in the IOAM Capabilities TLV, it means that the sending node is an IOAM transit node and IOAM proof of transit function is enabled at this IOAM transit node.

Sub-type is set to the value which indicates that it’s an IOAM Proof of Transit Capabilities sub-TLV.

Length is the length of the sub-TLV’s Value field in octets, and MUST be set to 4.

Namespace-ID field has the same definition as what’s specified in section 4.3 of [I-D.ietf-ippm-ioam-data], it should be a one of the Namespace-IDs listed in the IOAM Capabilities TLV of echo request.

IOAM-POT-Type field and P bit have the same definition as what’s specified in section 4.3 of [I-D.ietf-ippm-ioam-data]. If the IOAM
encapsulating node receives IOAM-POT-Type and/or P bit values from an IOAM transit node that are different from its own, then the IOAM encapsulating node MAY choose to abandon the proof of transit function or to select one kind of IOAM-POT-Type and P bit, it’s based on the policy applied to the IOAM encapsulating node.

SoR field has two bits which means the size of "Random" and "Cumulative" data, which are specified in section 4.3 of [I-D.ietf-ippm-ioam-data]. This document defines SoR as follow:

0b00 means 64-bit "Random" and 64-bit "Cumulative" data.

0b01~0b11: Reserved for future standardization

Reserved field is reserved for future use and MUST be set to zero.

2.2.4. IOAM Edge-to-Edge Capabilities sub-TLV

```
| 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
| Sub-type = E2E Capabilities |            Length             |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|        Namespace-ID           |         IOAM-E2E-Type         |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|TSF|TSL|       Reserved        |              MBZ              |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

Figure 6: IOAM Edge-to-Edge Capabilities Sub-TLV

When this sub-TLV is present in the IOAM Capabilities TLV, it means that the sending node is an IOAM decapsulating node and IOAM edge-to-edge function is enabled at this IOAM decapsulating node. That is to say, if the IOAM encapsulating node receives this sub-TLV, the IOAM encapsulating node can determine that the node which sends this sub-TLV is an IOAM decapsulating node.

Sub-type is set to the value which indicates that it’s an IOAM Edge-to-Edge Capabilities sub-TLV.

Length is the length of the sub-TLV’s Value field in octets, and MUST be set to 8.

Namespace-ID field has the same definition as what’s specified in section 4.4 of [I-D.ietf-ippm-ioam-data], it should be a one of the Namespace-IDs listed in the IOAM Capabilities TLV of echo request.
IOAM-E2E-Type field has the same definition as what’s specified in section 4.4 of [I-D.ietf-ippm-ioam-data].

TSF field specifies the timestamp format used by the sending node. This document defines TSF as follow:

- 0b00: PTP timestamp format
- 0b01: NTP timestamp format
- 0b10: POSIX timestamp format
- 0b11: Reserved for future standardization

TSL field specifies the timestamp length used by the sending node. This document defines TSL as follow:

When TSF field is set to 0b00 which indicates PTP timestamp format:

- 0b00: 64-bit PTPv1 timestamp as defined in IEEE1588-2008 [IEEE1588v2]
- 0b01: 80-bit PTPv2 timestamp as defined in IEEE1588-2008 [IEEE1588v2]
- 0b10~0b11: Reserved for future standardization

When TSF field is set to 0b01 which indicates NTP timestamp format:

- 0b00: 32-bit NTP timestamp as defined in NTPv4 [RFC5905]
- 0b01: 64-bit NTP timestamp as defined in NTPv4 [RFC5905]
- 0b10: 128-bit NTP timestamp as defined in NTPv4 [RFC5905]
- 0b11: Reserved for future standardization

When TSF field is set to 0b10 or 0b11, the TSL field would be ignored.

Reserved field is reserved for future use and MUST be set to zero.
2.2.5. IOAM End-of-Domain sub-TLV

When this sub-TLV is present in the IOAM Capabilities TLV, it means that the sending node is an IOAM decapsulating node. That is to say, if the IOAM encapsulating node receives this sub-TLV, the IOAM encapsulating node can determine that the node which sends this sub-TLV is an IOAM decapsulating node. When the IOAM Edge-to-Edge Capabilities sub-TLV is present in the IOAM Capabilities TLV sent by the IOAM decapsulating node, the IOAM End-of-Domain sub-TLV doesn’t need to be present in the same IOAM Capabilities TLV, otherwise the End-of-Domain sub-TLV MUST be present in the IOAM Capabilities TLV sent by the IOAM decapsulating node. Since both the IOAM Edge-to-Edge Capabilities sub-TLV and the IOAM End-of-Domain sub-TLV can be used to indicate that the sending node is an IOAM decapsulating node, it’s recommended to include only the IOAM Edge-to-Edge Capabilities sub-TLV if IOAM edge-to-edge function is enabled at this IOAM decapsulating node.

Length is the length of the sub-TLV’s Value field in octets, and MUST be set to 4.

Namespace-ID field has the same definition as what’s specified in section 4.4 of [I-D.ietf-ippm-ioam-data], it should be a one of the Namespace-IDs listed in the IOAM Capabilities TLV of echo request.

3. Operational Guide

Once the IOAM encapsulating node is triggered to acquire IOAM capabilities of each IOAM transit node and/or IOAM decapsulating node, the IOAM encapsulating node will send a batch of echo requests that include the IOAM Capabilities TLV, first with TTL equal to 1 to reach the nearest node which may be an IOAM transit node or not, then with TTL equal to 2 to reach the second nearest node which also may be an IOAM transit node or not, on the analogy of this to increase 1 to TTL every time the IOAM encapsulating node sends a new echo request, until the IOAM encapsulating node receives echo reply sent
by the IOAM decapsulating node, which should contain the IOAM
Capabilities TLV including the IOAM Edge-to-Edge Capabilities sub-TLV
or the IOAM End-of-Domain sub-TLV. Alternatively, if the IOAM
encapsulating node knows exactly all the IOAM transit nodes and/or
IOAM decapsulating node beforehand, once the IOAM encapsulating node
is triggered to acquire IOAM capabilities, it can send echo request
to each IOAM transit node and/or IOAM decapsulating node directly,
without TTL expiration.

The IOAM encapsulating node may be triggered by the device
administrator, the network management system, the network controller,
or even the live user traffic, and the specific triggering mechanisms
are outside the scope of this document.

Each IOAM transit node and/or IOAM decapsulating node that receives
an echo request containing the IOAM Capabilities TLV will send an
echo reply to the IOAM encapsulating node, and within the echo reply,
there should be an IOAM Capabilities TLV containing one or more sub-
TLVs. The IOAM Capabilities TLV contained in the echo request would
be ignored by the receiving node that is unaware of IOAM.

4. Security Considerations

Knowledge of the state of the IOAM domain may be considered
confidential. Implementations SHOULD provide a means of filtering
the addresses to which echo request/reply may be sent.

5. IANA Considerations

This document has no IANA actions.

6. Acknowledgements
