IPv6 Router Advertisement Option for Stateless DHCP Server

draft-xu-ipv6-ra-dhcp-server-option-00

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/1id-abstracts.txt.

The list of Internet-Draft Shadow Directories can be accessed at http://www.ietf.org/shadow.html.

This Internet-Draft will expire on August 5, 2010.

Abstract

This document proposes a new Router Advertisement option which allows IPv6 hosts to obtain the addresses of stateless DHCP servers automatically. Thus, IPv6 hosts can directly contact stateless DHCP servers using unicast.

1. Terminologies

This document uses the terminology defined in Stateless Address Autoconfiguration[RFC2460], DHCPv6 specification[RFC3315] and Stateless DHCP[RFC3736].

2. Introduction

After obtaining IPv6 addresses through some other mechanisms such as Stateless Address Autoconfiguration[RFC2462] or manual configuration, IPv6 hosts can attempt to use stateless DHCP[RFC3736] to obtain other configuration information (e.g., DNS recursive name servers). To achieve this, the DHCP client first sends an Information-Request message to the All_DHCP_Relay_Agents_and_Servers multicast address. DHCP servers receiving the Information-Request message then respond with a Reply message containing the desired configuration information. If the DHCP client and DHCP servers are not located in a same broadcast domain, the traffic between the client and the DHCP servers need to be relayed by DHCP Relay Agents.

If the client can obtain the address of a stateless DHCP server from someplace in advance, it can directly send Information-Request messages to the DHCP server. This approach can eliminate the latencies imposed by relay agents and prevent the client from receiving redundant responses from multiple DHCP servers. Additionally, unicast messages are more difficult to intercept than multicast messages. Therefore, if a client uses unicast to contact DHCP servers, the security issues caused by rogue DHCP server can be mitigated to some extent. Of course, this benefit is based on the presumption that the rogue IPv6 Router Advertisement problem [I-D.draft-ietf-v6ops-rogue-ra-00] has been solved successfully.

The document introduces a new Router Advertisement option called the Stateless DHCP Server option which contains the IP addresses of stateless DHCP servers. After obtaining the address of a stateless DHCP server from this RA option, a client can use unicast to directly communicate with the server.

3. RA Option for Stateless DHCP Server

A Stateless DHCP Server option contains at least one stateless DHCP server address. If there are multiple addresses, all of them share a same lifetime value. If different lifetime values are desired, the IP addresses can be encapsulated within different options. Figure 1 shows the format of the Stateless DHCP Server option.
Fields:

Type  8-bit identifier of the Stateless DHCP Server option type to be assigned by the IANA;

Length  8-bit unsigned integer. The length of the option (including the Type and Length fields) is in units of 8 octets. The minimum value is 3 if one IPv6 address is contained in the option. Every additional DHCP Server address increases the length by 2. The Length field is used by the receiver to determine the number of IPv6 addresses in the option.

Lifetime  32-bit unsigned integer. The maximum time, in seconds (relative to the time the packet is sent), over which this DHCP Server address MAY be used for obtaining configuration information. Hosts MAY send a Router Solicitation to ensure the DHCP Server information is fresh before the interval expires.

Addresses of Stateless DHCP Servers

One or more 128-bit IPv6 addresses of the stateless DHCP servers. The number of the addresses can be derived from the value of the Length field. Specifically, the number of addresses is equal to (Length - 1) / 2.
4. DHCPv6 Extensions

After obtaining the address of a DHCP server from the Stateless DHCP Server option, a client COULD send an information-Request message directly to the DHCP server via unicast.

In [RFC3315], we found the following statement: "A server MUST discard any Solicit, Confirm, Rebind or Information-request messages it receives with a unicast destination address." We believe that the designers of DHCPv6 assumed that clients have no knowledge about the IP addresses of DHCP servers at the time they send Information-request messages. Therefore, if a DHCP server receives an Information-request message with a unicast destination address, it will regard it as an abnormal message. However, in the scenarios where clients can get the IP addresses of DHCP servers from someplace else, this assumption is invalid anymore. Therefore, we argue that a stateless DHCP server should accept an Information-request messages it receives with a unicast destination address.

5. Security Considerations

In practice, DHCP relay agents can be used to slower or damp the frequency of attacks on the DHCP servers. However, when using our solution, attackers can get the IP addresses of DHCPv6 servers in advance, and so they can bypass replay agents and send flooding traffic to DHCPv6 servers directly. Regarding this issue, we argue that since the stateless DHCP server doesn’t need to maintain any dynamic state for individual clients, this kind of flooding attack on the DHCP Servers will not be worse than the attacks on DNS servers.

6. IANA Considerations

The IANA should assign an IPV6 Neighbor Discovery option for the Option defined in this document in the "IPv6 Neighbor Discovery Option Formats" registry.

7. Acknowledgements

Thanks to Dujuan Gu for her valuable input about rogue DHCP server problems.
